

# MINNESOTA NWI UPDATE

Steve Kloiber  
Wetland Monitoring Coordinator  
Minnesota Department of Natural Resources

# Outline

- Project Background / Status
- Quality Assurance Procedures / Plan
- Quality Control – Data Validation

# State Strategy

- Update the National Wetland Inventory in MN
- Status and Trends program for quantity & quality
- On-line permitting and restoration database

# Why do we need an NWI update?

Some things have changed.

# Why do we need an NWI update?

Some things have changed.

# Why do we need an NWI update?

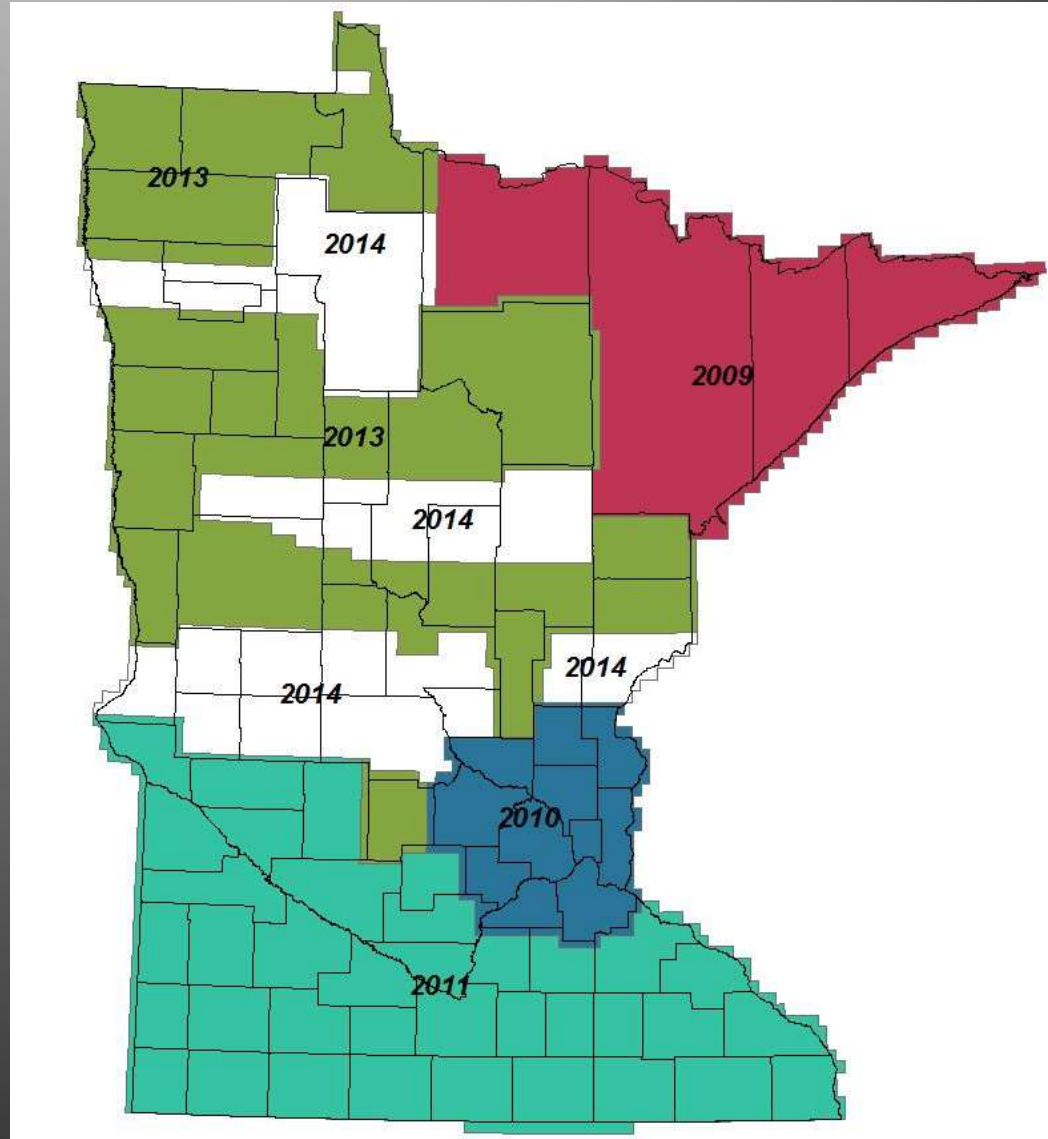

Some things have changed.

# Spring Imagery Acquisition

## Conducted in Geographically Defined Phases

- 0.5-meter or 1-foot resolution
- Percent complete = 82%
- Percent pending = 18%

# Wetland Mapping

## Conducted in Geographically Defined Phases

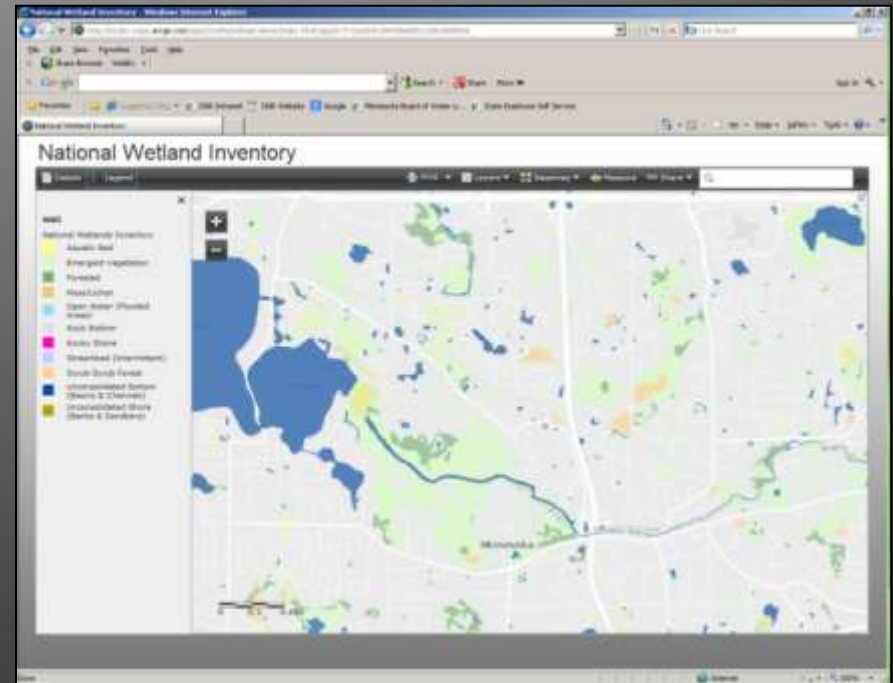

- Complete = 9% 
- In-progress = 46% 
- Pending = 45% 

# Project Schedule & Data Access

- Completion: 2019 (depending)
- Download from DNR Data Deli
- Also download through USFWS
- Online viewing at:

<http://www.dnr.state.mn.us/eco/wetlands/map.html>

# QUALITY CONTROL

for the NWI Update of Minnesota

# Definitions

- QA focuses on process improvement to prevent errors
- QC focuses on identifying errors in the finished product

# QA/QC Plan

- Blueprint to ensure data are fit for purpose
- Document data quality objectives
- Describes systematic monitoring process

# Define Data Quality Objectives

- Review problems with related datasets
- Review available standards and literature
- Specific objectives vary depending end user needs

# Data Quality Objective Categories

- Precision/reproducibility (positional & attribute)
- Accuracy (positional & attribute)
- Resolution (scale, level of detail, MMU, etc.)
- Consistency (logical & topology)
- Completeness

# Incorporating Requirements / DQOs

## EXHIBIT A – SCOPE OF WORK

### 1.2. Project Requirements

#### Cowardin Classification

Wetlands will be mapped and classified according to Cowardin et al. (1979) including the system, subsystem, class, sub-class, water regime, and special modifiers.

#### Simplified Plant Community Classification

The NWI update will also include an additional set of attributes to describe the wetland plant community type based on a modified version of the Eggers and Reed classification system developed by the Minnesota DNR.

#### Simplified Hydro-Geomorphologic Classification

The NWI update will also include an additional set of attributes to describe the hydro-geomorphologic setting of wetlands based on a modified version of Turner's LLWW system developed by the Minnesota DNR.

#### Target Mapping Unit

Wetlands  $\geq \frac{1}{4}$ -acre in area are subject to accuracy assessment requirements defined herein; however wetlands smaller than  $\frac{1}{4}$ -acre that are visible at 1:6000-scale will also be mapped.

#### Classification Accuracy

The final wetland data will meet the classification accuracy goals including a producer's accuracy  $\geq 98\%$  for wetland features ( $\geq \frac{1}{4}$ -acre) that are visible on the imagery and an overall classification accuracy  $\geq 85\%$  for the Cowardin class level. In addition, the final wetland maps will have a user's accuracy  $\geq 92\%$  for wetland features. Evaluation of this goal will be conducted by the DNR using a validation dataset developed by the DNR Division of Ecological and Water Resources.

#### Horizontal Accuracy

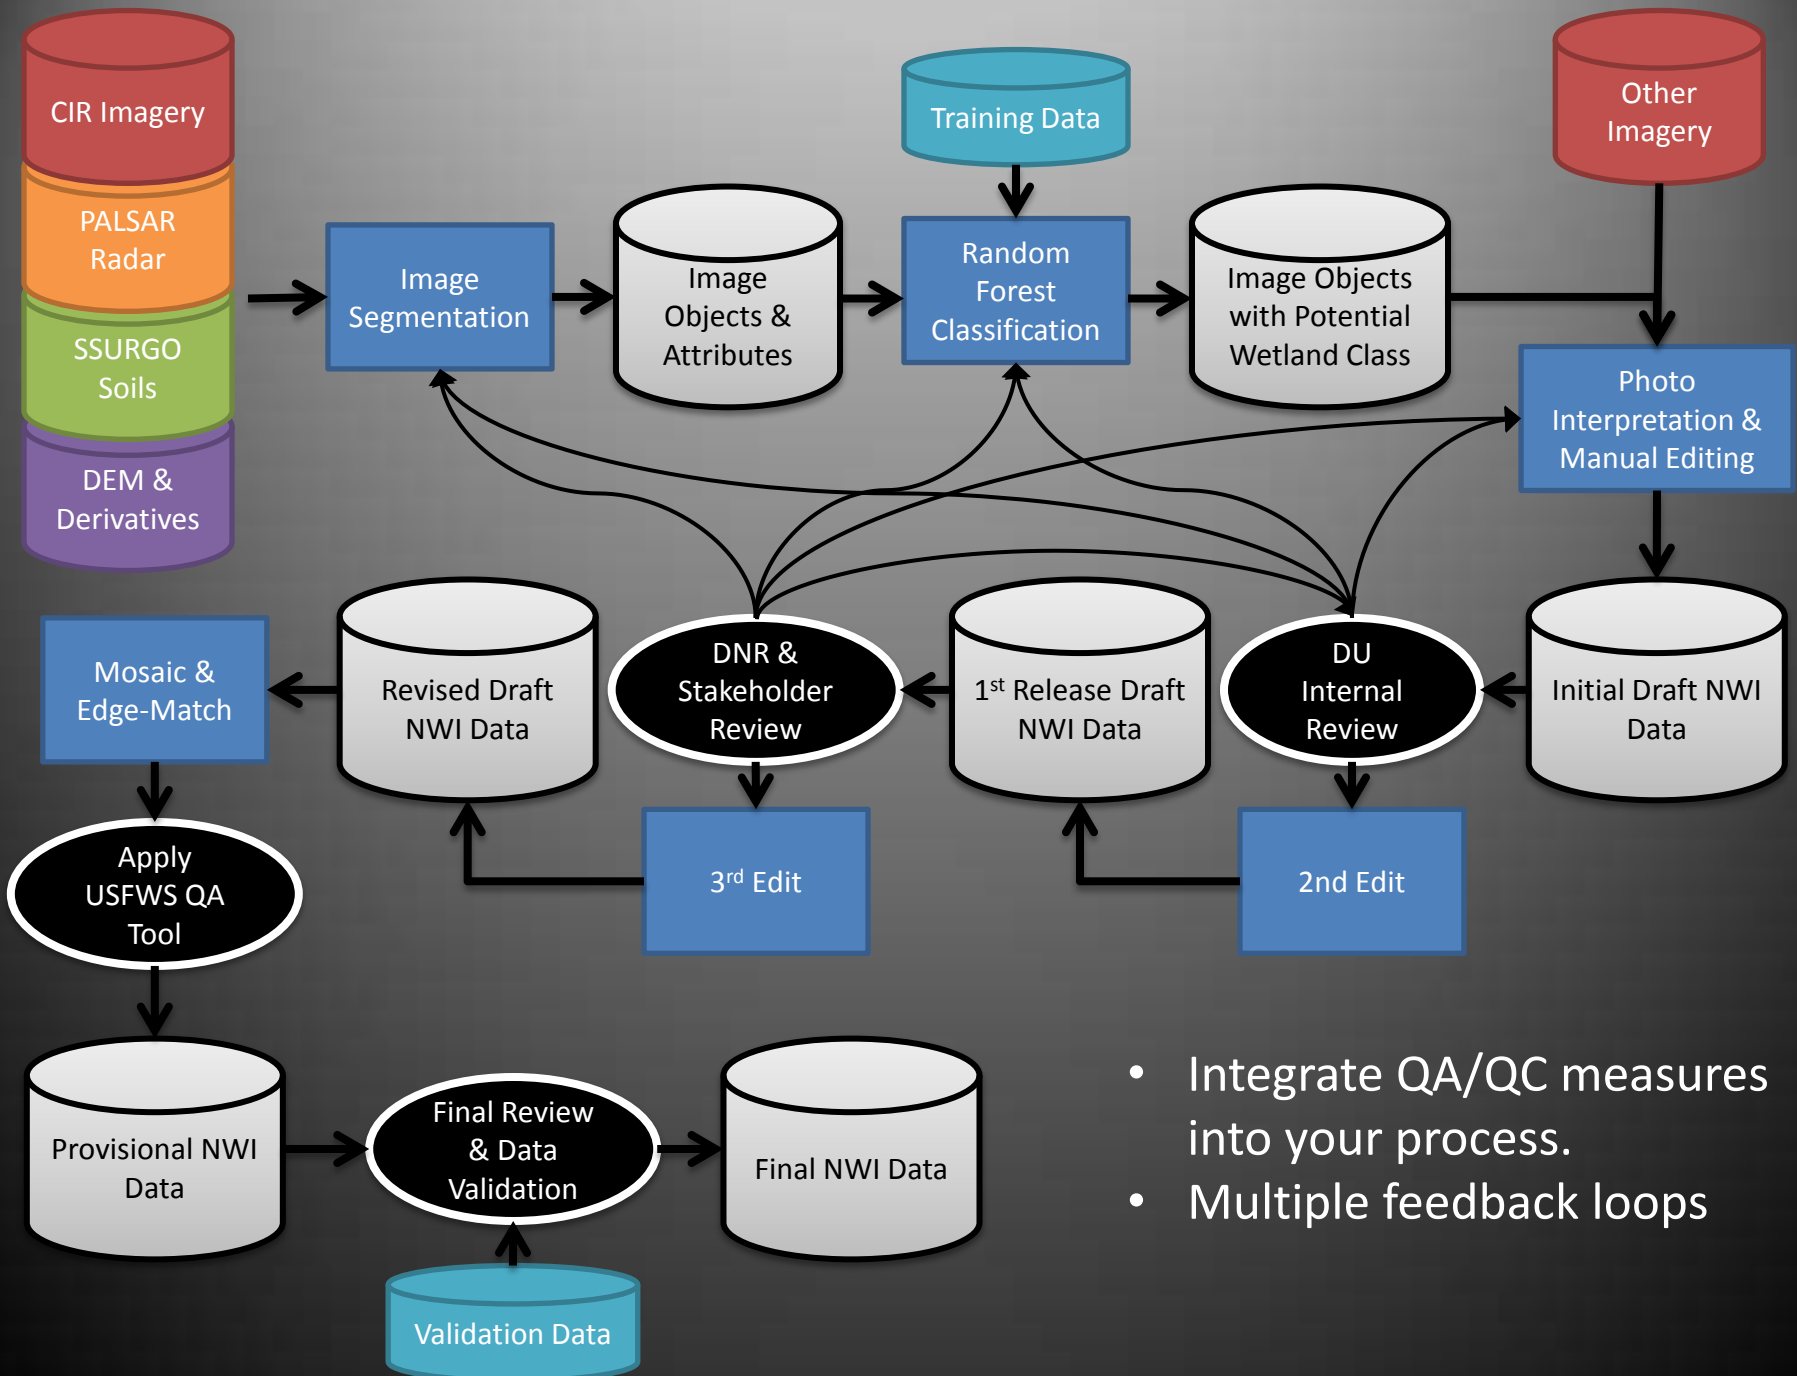

Wetland boundaries will be coincident with the base imagery. This means that 95% of well-defined boundaries (e.g. water-land boundaries) will occur within 20 feet of the boundary position on the base imagery.

#### Data Verification

The data must be logically consistent and topologically complete. The data must be complete polygons with no overlaps and no gaps between adjacent polygons. The final data must be edge-matched across tile boundaries into a seamless coverage. Whenever practical, boundaries should be edge-matched to data for areas adjacent to the project area. Wetland classification attributes will be checked to ensure that only valid attributes are used.

#### Metadata Information

Metadata for this project will meet the requirements of the Minnesota Geographic Metadata Guidelines. Metadata information will include a tested classification accuracy statement, an error matrix, a full description of the data lineage, and spatial reference information (<http://www.lmic.state.mn.us/chouse/meta.html>).

- Integrate QA/QC measures into your process.
- Multiple feedback loops

# Desktop Feedback Loop

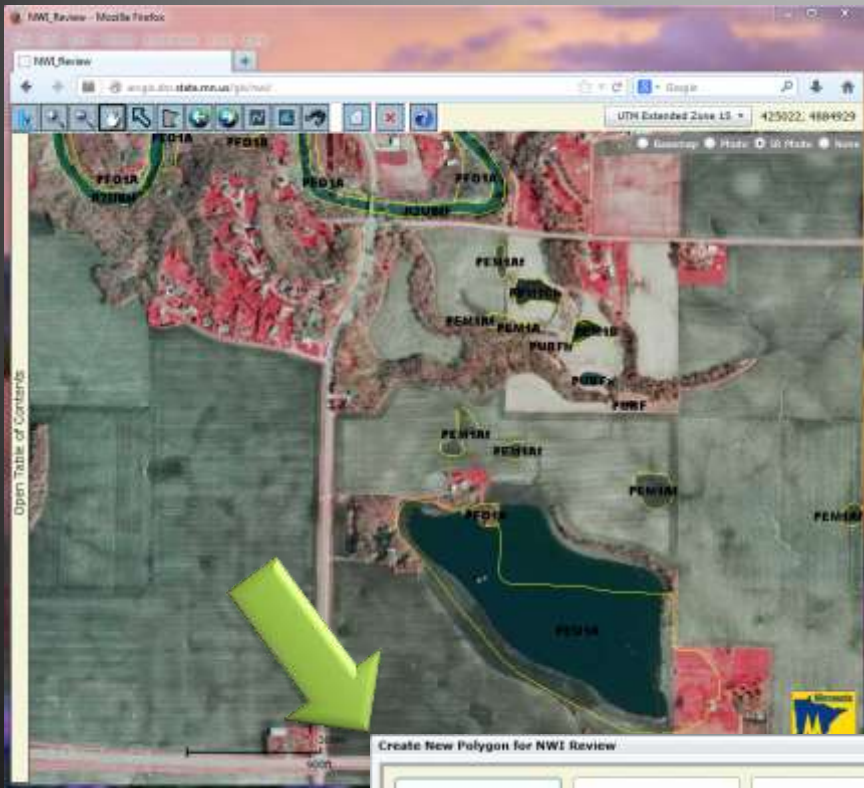

- Wetlands from DOQQ process are compared to stereo imagery
- Stereo visualization can improve interpretation
  - Sharper images
  - More precise locations

# Field Feedback Loop

- Field checking on selected wetland polygons

# Crowdsourcing Feedback Loop

Create New Polygon for NWI Review

<b>Add</b> indicate wetland or portion that needs to be added	<b>Delete</b> indicate wetland or portion that needs to be deleted	<b>Change</b> indicate wetland or portion that has wrong classification or add comments
--	---	--

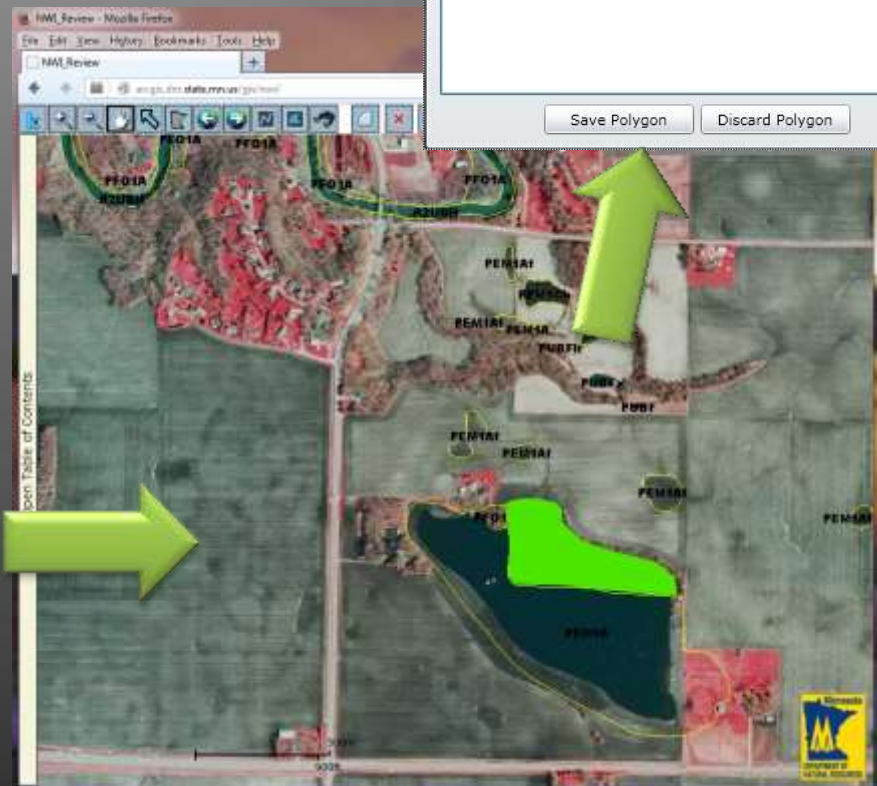

**Instructions**

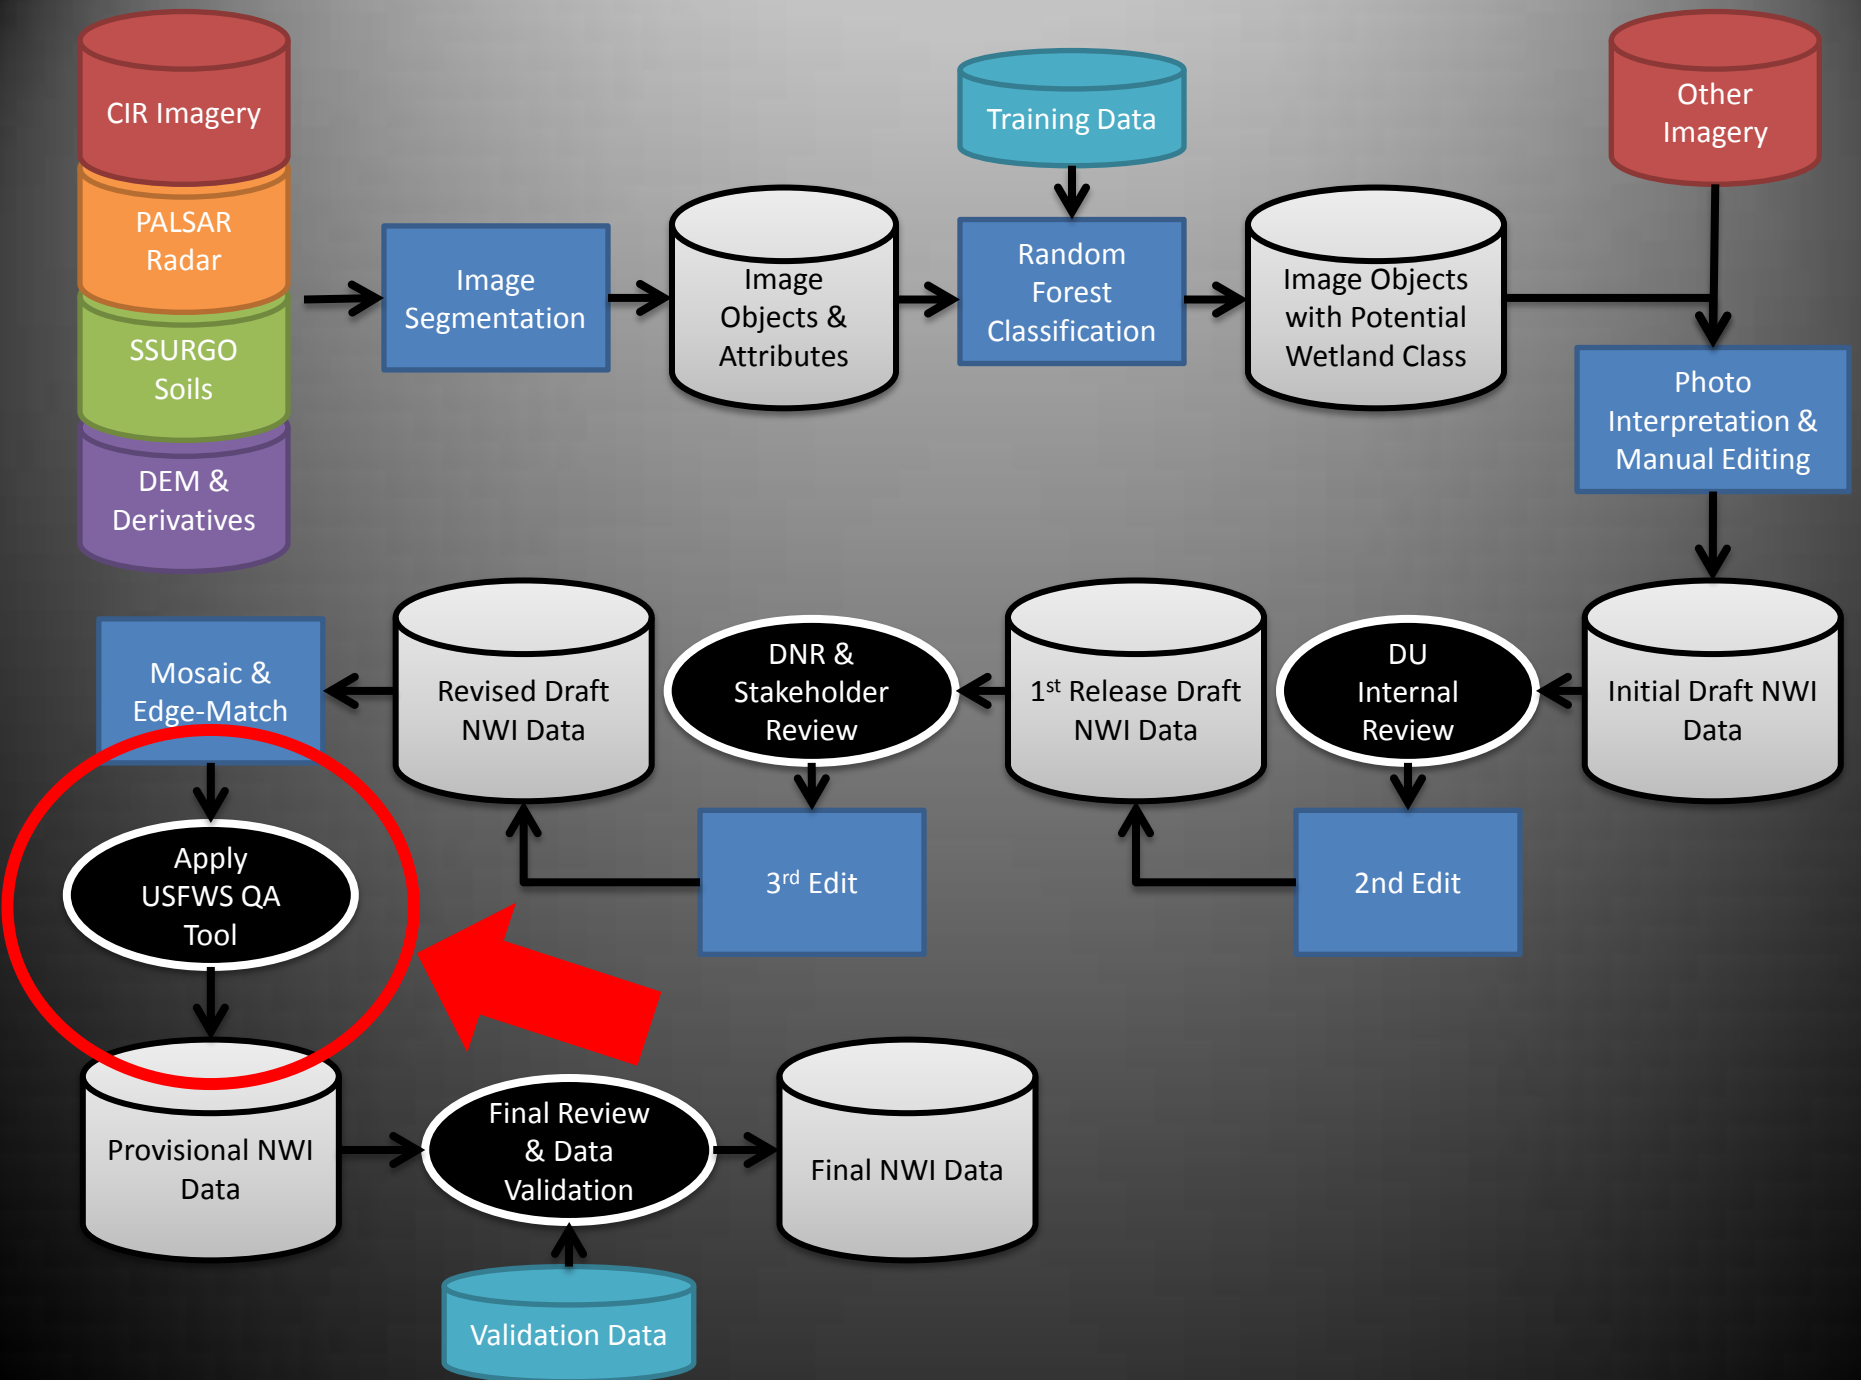

- 1) Click on the appropriate button above to Add, Delete, or Change
- 2) Digitize a rough sketch around the wetland (double click to end)
- 3) Add comments

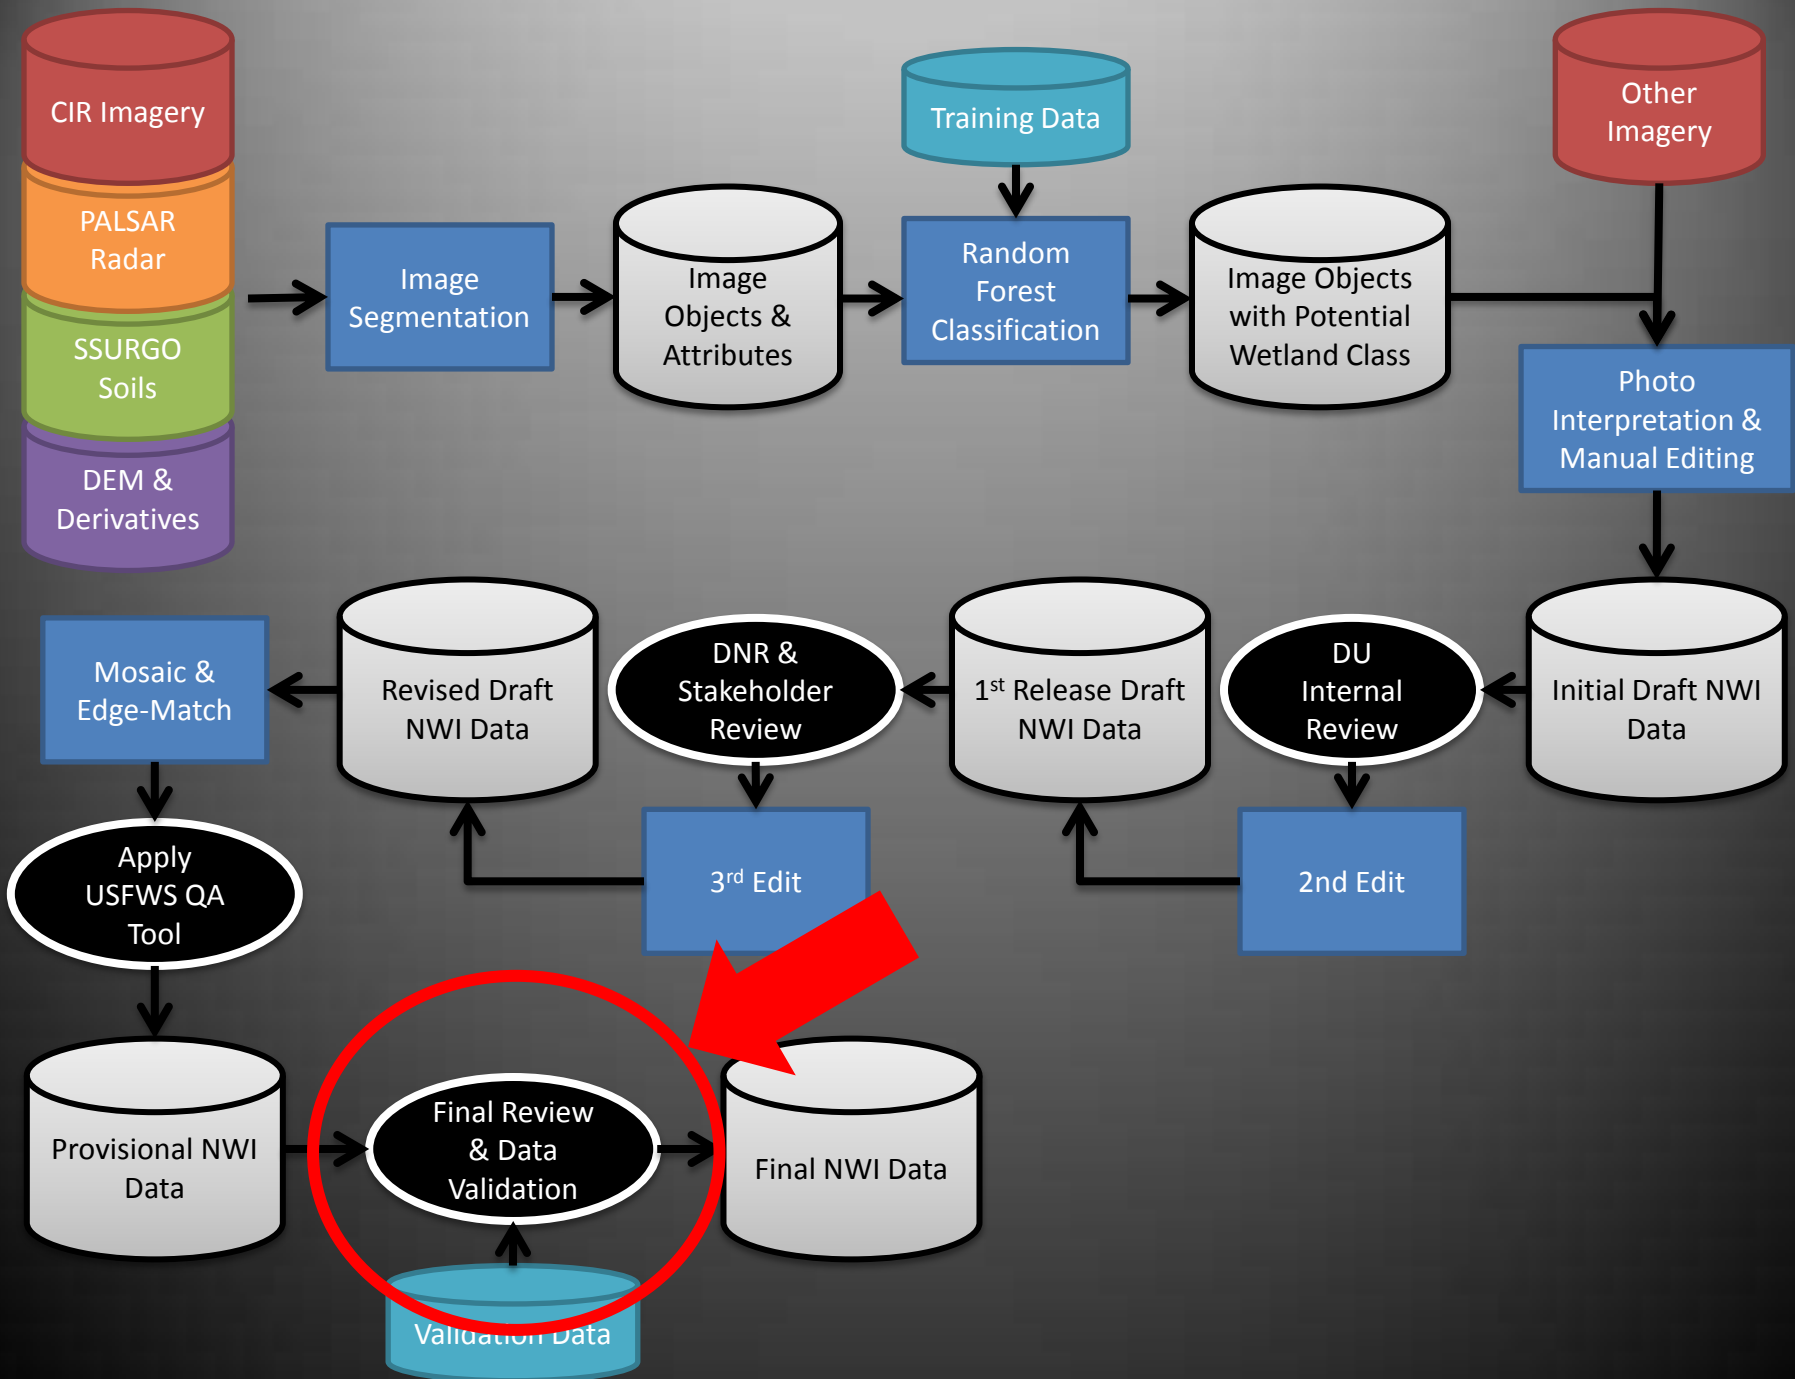

AddComments

Save Polygon    Discard Polygon

# FGCD Wetland Mapping Accuracy Goal

- “Ninety-eight percent of all wetlands visible on an image, at the size of the TMU or larger shall be mapped regardless of the origin (natural, farmed, or artificial).”

# Questions About the FGDC Goal

- Assessment methods
  - Field-check or photo-interpretation
  - Points or polygons
  - Handling confusion between classification error and positional error
- Is a 98% producer's accuracy feasible
- Why is there no goal for user's accuracy

# Field vs Photo-Interpretation

- PI method
  - “Visible” standard implies PI
  - Visible to whom?
  - PI experience = accurate?
- Field method
  - Field accuracy > PI accuracy
  - Time consuming, expensive
  - Access restrictions

# Points vs. Polygons

# Classification Error or Positional Error

# Validation Data

## Field points

- Stratified-random
- 75% wetland /25% upland
- Field-checked by UMN
- $\pm 5.64$  meters (image+GPS)
- Audited

## PI points

- Interpreted from high-resolution digital stereo imagery
- 75% wetland /25% upland
- $\pm 1.53$  meters (image)

# Feature Assessment Using PI Points for East-Central MN

Reference Determination	Map Determination		
	Upland	Wetland/DW	Total
Upland	208	12	220
Wetland/Deepwater	47	624	671
Total	255	636	891

Overall Accuracy	93%
Wetland Producer's Accuracy	93%
Wetland User's Accuracy	98%

# Feature Assessment Using Field Points for East-Central MN

Reference Determination	Map Determination		
	Upland	Wetland/DW	Total
Upland	201	18	219
Wetland/Deepwater	54	470	524
Total	255	488	743

Overall Accuracy	90%
Wetland Producer's Accuracy	90%
Wetland User's Accuracy	96%

# Class Assessment Using PI Points for East-Central MN

Reference Class	Map Class													Total	
	L1UB	L2AB	L2EM	L2UB	L2US	PAB	PEM	PFO	PSS	PUB	R2AB	R2UB	R2US		UPL
L1UB	39			5								8			52
L2AB	2	26	9	3		1	4								45
L2EM															0
L2UB	5	3	3	31								3			45
L2US					1										1
PAB						21	5			11	1	1			39
PEM						2	99	2	1	1				18	123

<b>Total</b>	46	30	12	40	1	48	137	41	25	154	1	78	6	257	876

# Reflections on Class Error Matrix

- An “accuracy” assessment
  - Implies the reference data are 100% accurate
- Some common classes aren’t reliably separated with field observation or remote sensing
  - Temporal variability (AB – UB)
  - Spectrally indistinguishable (L1 – L2)

# Temporal Variability

# Temporal Variability

# Temporal Variability

# Temporal Variability

# Spectrally Indistinguishable

# Spectrally Indistinguishable

# Wetland Class Accuracy

- Photo-interpreted validation data
- Wetland & deepwater classes only
- Overall class accuracy
  - All points = 78%
  - AB/UB confusion excluded = 84%
  - L1/L2 and AB/UB excluded = 86%

# Take Home Message

- QA/QC shouldn't just happen at the end
  - Have a plan
- Accuracy assessment is complex
  - Many decisions influence results
  - FGDC standard does not provide guidance

# A Modest Proposal

Producer & User Accuracy Wetland/Upland	Quality Grade
Both > 95%	A
95% > Both > 90%	B
90% > Both > 80%	C
80% > Both > 70%	D
Both < 70%	F

## East-Central MN

Producer Accuracy = 93%

User Accuracy = 98%

Overall Quality Grade = A-

An aerial photograph of a landscape, possibly a wetland or marsh, showing a large, irregular black hole in the center. The surrounding terrain is a mix of green and brown, with some areas appearing to be water or mud. The text "Questions?" is overlaid in white in the lower center of the image.

Questions?
