

Mapping Wetlands Using Ecological Site Descriptions

Richard Weber
Wetland Hydraulic Engineer
Wetland Team
CNTSC, Fort Worth, TX

Goals and Assumptions:

- Need to Spatially Define Wetland *Landscapes*
- Landscapes can be Delineated by Function
- Wetland Functions are Dominated by *Hydrology*
- Hydrologic Function and *Soil Attributes* are Interrelated
- Landscapes Exist as *Watershed Elements*
- Within a Certain "Reference Domain", Landscapes can be Categorized by Position and Function
- Landscapes can be used to BUILD WATERSHEDS

Available Data Sources and Classification Systems:

- Soil Survey Geographic (SSURGO) Database
 - Raster Data
 - Vector Polygons
 - Large Attribute Database
- Hydrogeomorphic (HGM) Classification System
- Ecological Site Descriptions
- Digital Elevation Data (DED)
 - 30m and 10m
 - High Resolution (LIDAR, IFSAR, etc.)

Cowardin Classification

Based on:

- Hydrologic Regime
- Plant Community
- Broad Landscape Attributes (Riverine, Tidal, Other)

Works well for:

- Mapping jurisdictional wetland boundaries
- Drawing polygons from remotely sensed imagery

Works less well for:

- Analysis of landscape function
- Use in the Watershed Approach

Newer Efforts:

- HGM Informed Cowardin Classification (LLWW)

Ecological Site Descriptions:

An ecological site is a conceptual division of the landscape, defined as a “distinctive kind of land based on recurring soil, landform, geological, and climate characteristics that differs from other kinds of land in its ability to produce distinctive kinds and amounts of vegetation and in its ability to respond similarly to management actions and natural disturbances

- Vegetation Based
- NRCS, USFS, and BLM Effort

Hydrogeomorphic Landscape Classes

US Army Corps

Engineer Research and
Development Center

ERDC/E

A Regional Guidebook for Applying the
Hydrogeomorphic Approach to Assessing
Wetland Functions of Riverine Floodplains
in the Northern Rocky Mountains

August 2002

- Originally for Development of "Functional Assessment Models" (Brinson, et. al.)
- Starts with 7 Wetland Classes
- Requires the Determination of a "Reference Domain" where a certain "subclass" exists
- Function Based

Env

FHWA

USDA NRCS
National Conservation Center

Three Factors that Define HGM *Landscape* Classes

- Landscape Position *in the watershed*
- Dominant Water Source
- Hydrodynamics

The Seven HGM Classes

- RIVERINE
- SLOPE
- MINERAL SOIL FLAT
- ORGANIC SOIL FLAT
- ESTUARINE FRINGE
- LACUSTRINE FRINGE
- DEPRESSION

Depressional
Carolina Bay

Estuarine Fringe
Oregon

Mineral Flats
Indiana Flatwoods

Slope
Puerto Rico

Subclasses in a local Reference Domain

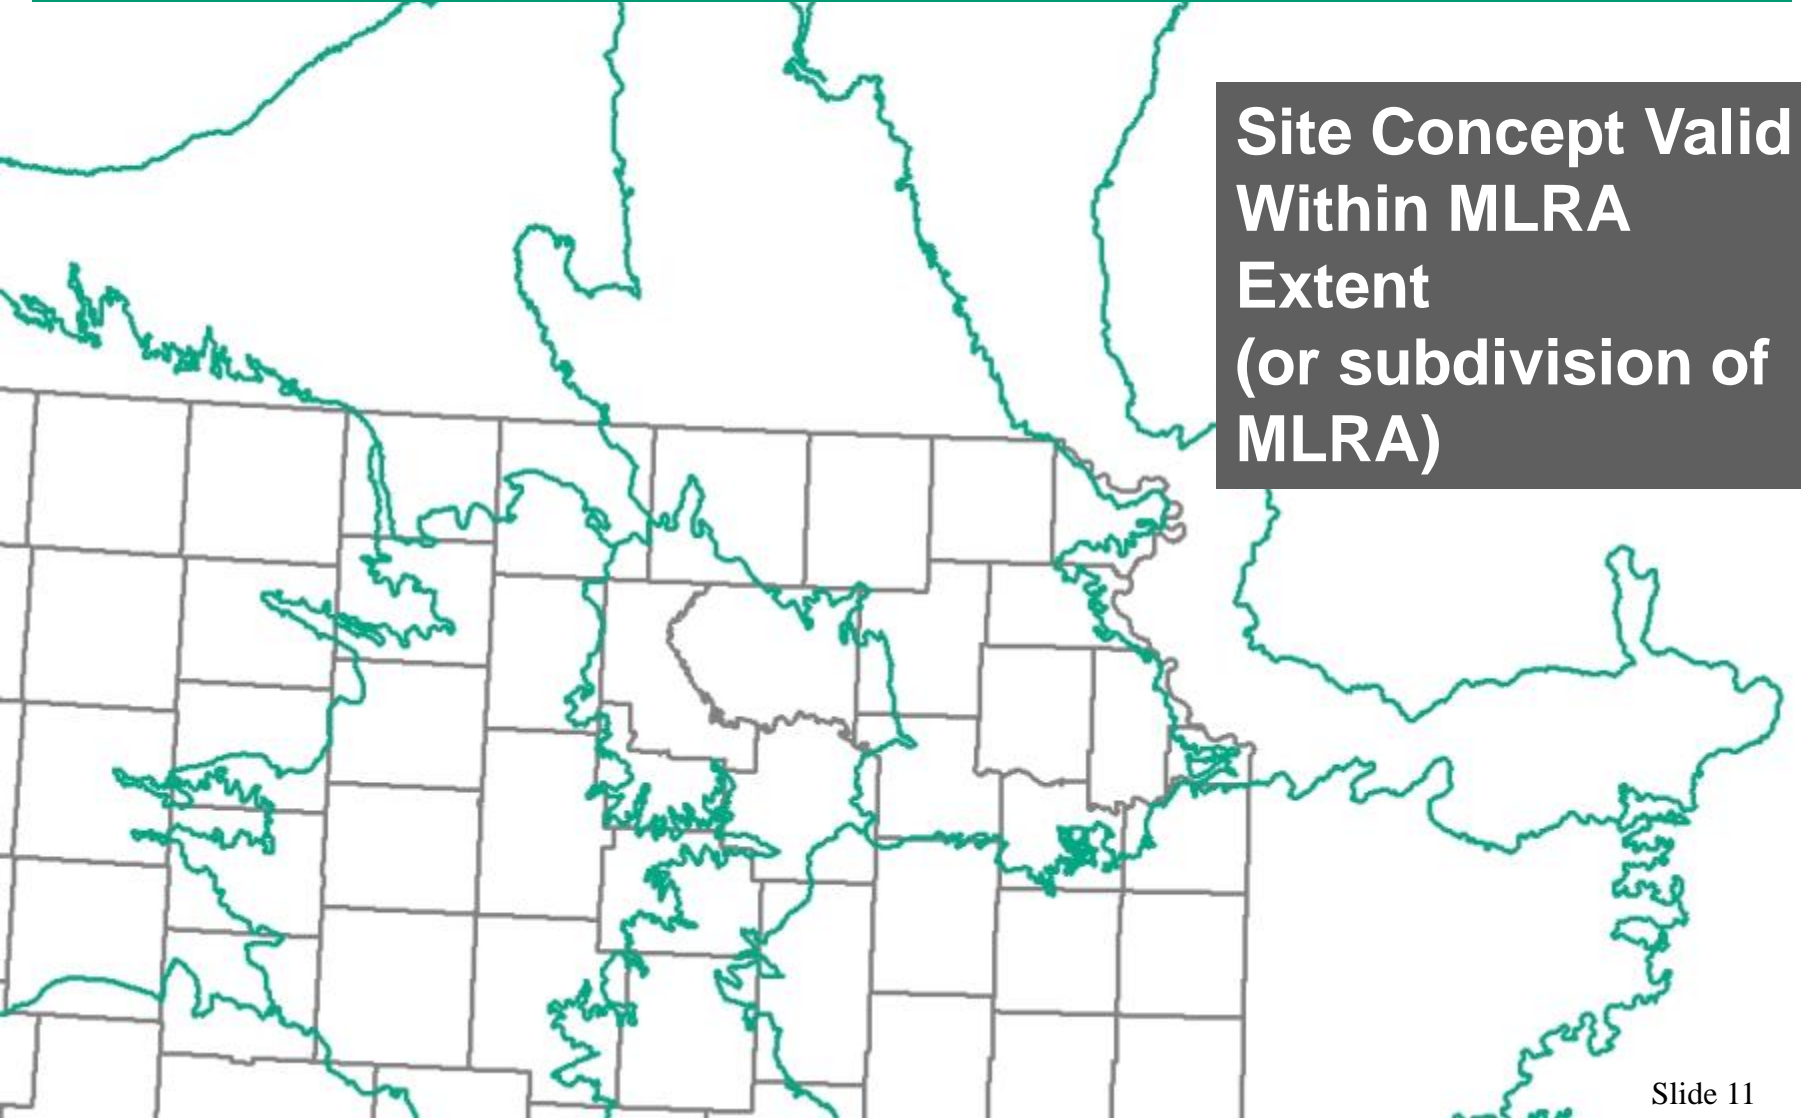

Merging ESD and HGM Concepts

- Landscape Boundaries based on similar soil hydrodynamic processes
- Site Concepts are valid up to the Major Land Resource Area (MLRA) Extent
- Ecological Sites for Wetland Landscapes and HGM landscape classifications are the same
- Valid Site Concepts can be mapped across the MLRA Extent
- Sites may contain landscapes with certain HGM class wetlands, but are NOT wetland boundaries

Basic Data, Tools, and Skillset:

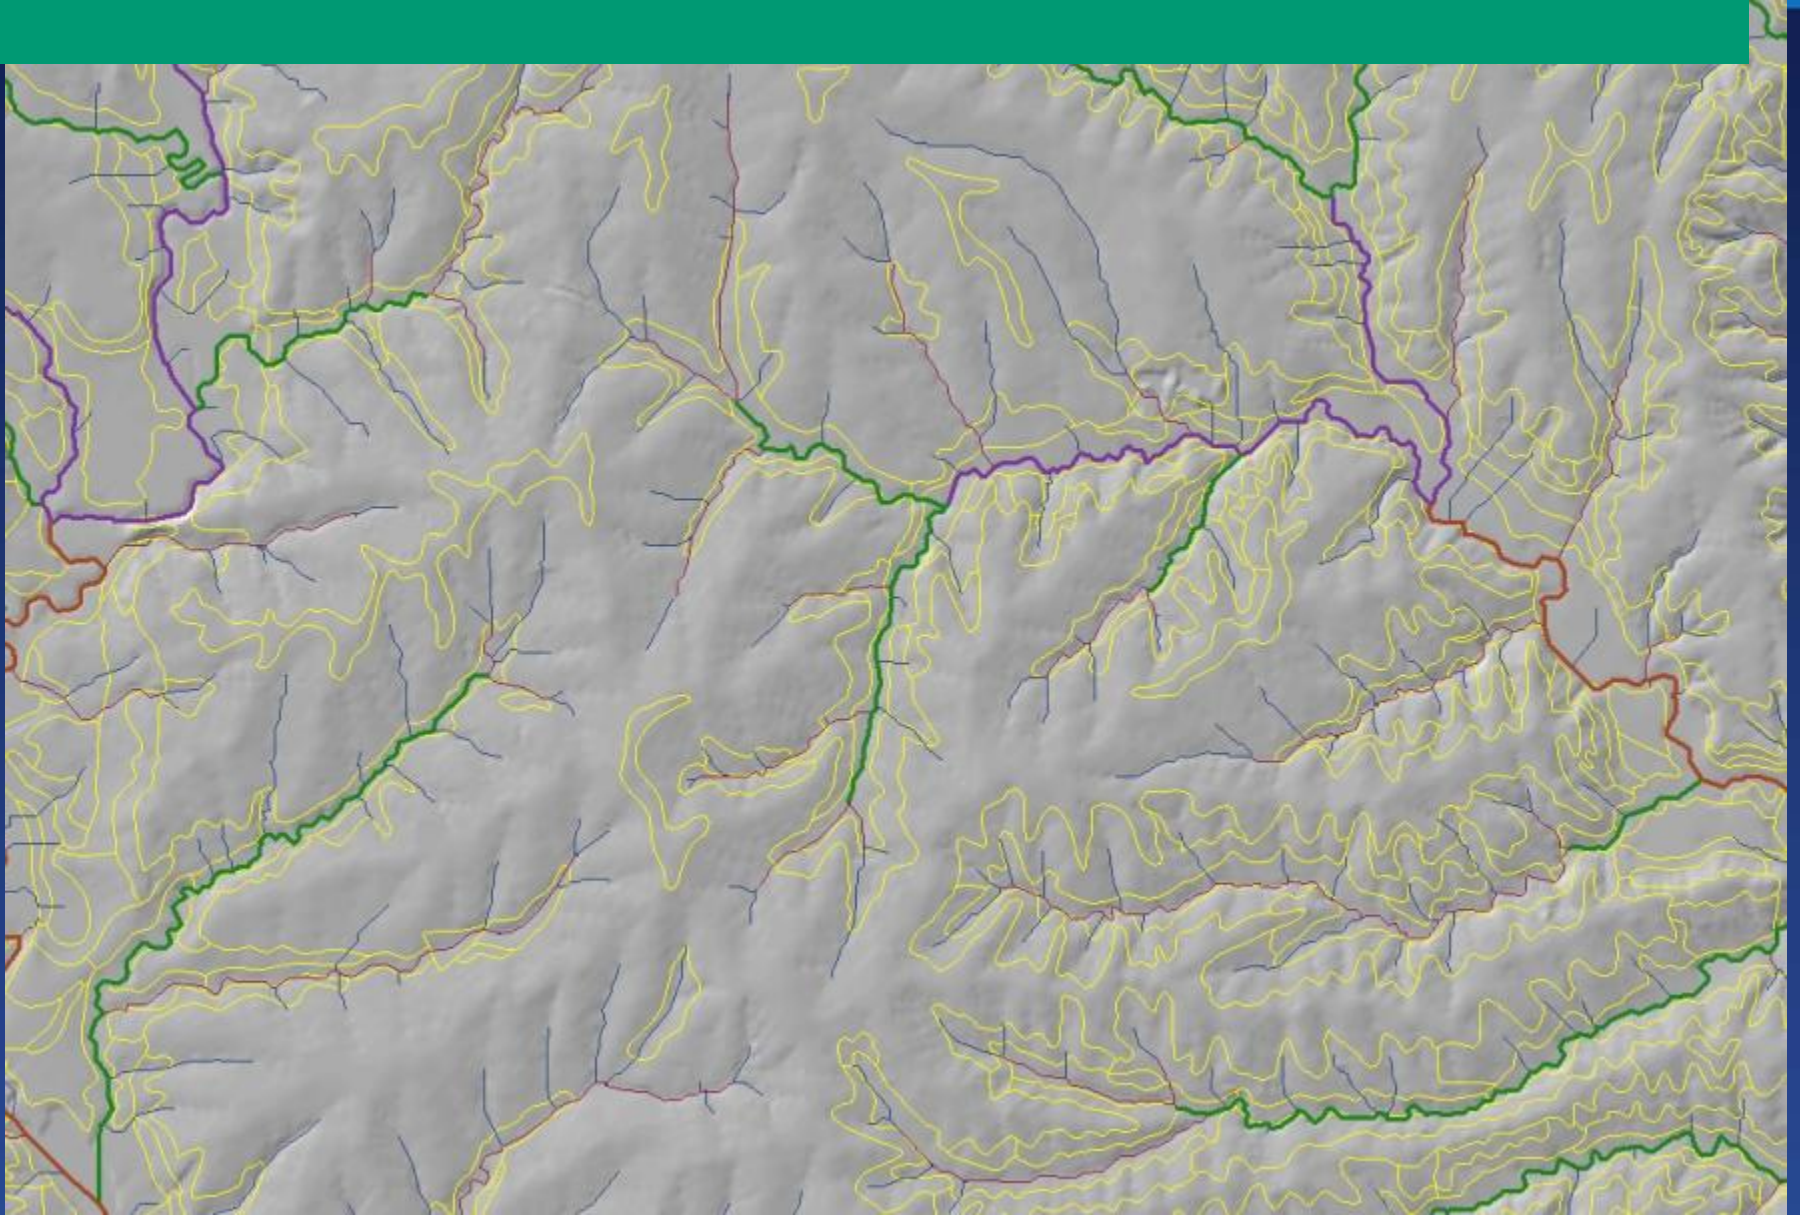

- SSURGO (raster or vector, and tabular data)
- Digital Elevation Data
- GIS Software
- Knowledge of Spatial Analyst Tools
- Knowledge of SSURGO dataset
- MLRA Boundary Data
- HUC Boundary Data
- Aerial Imagery

Major Land Resource Areas

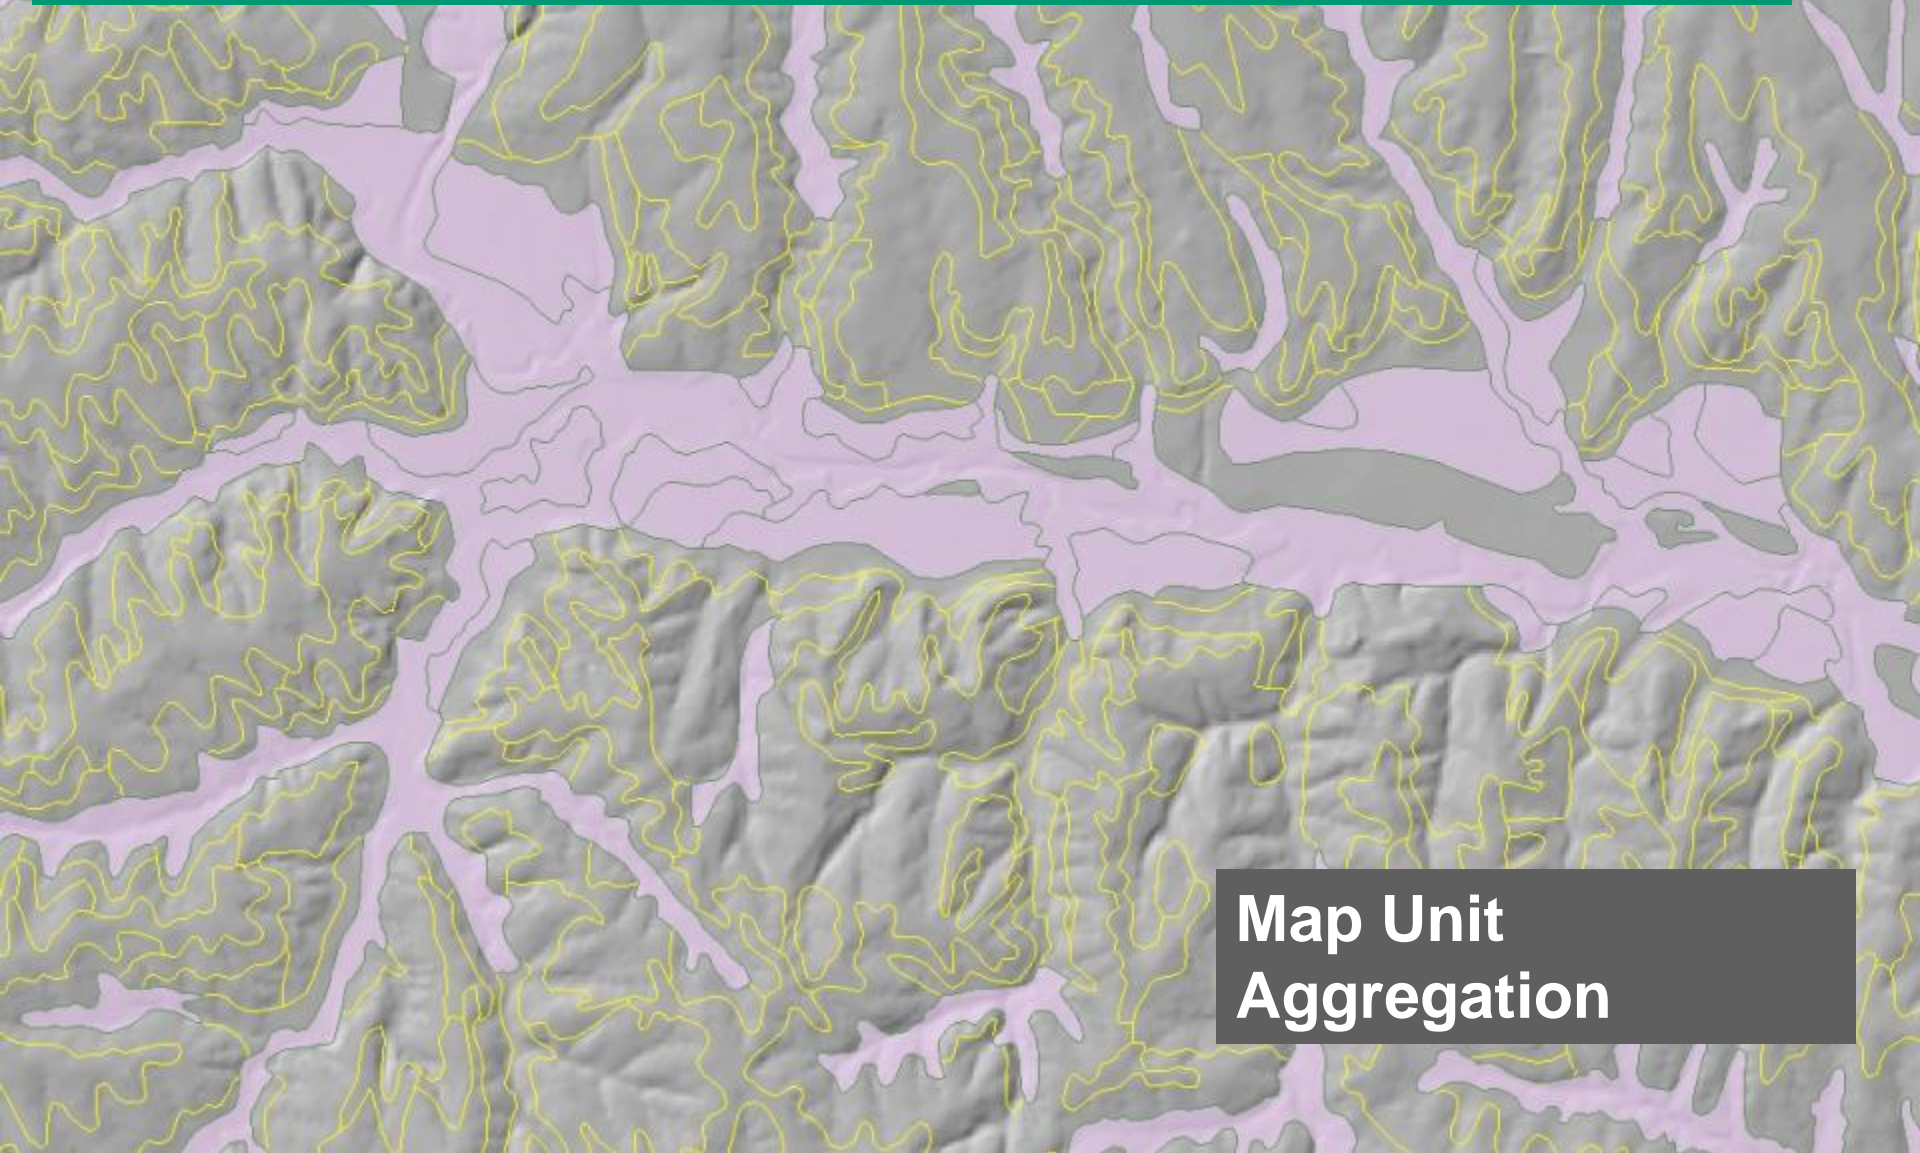

**Site Concept Valid
Within MLRA
Extent
(or subdivision of
MLRA)**

Map Unit Polygons

Occasionally Flooded Polygons

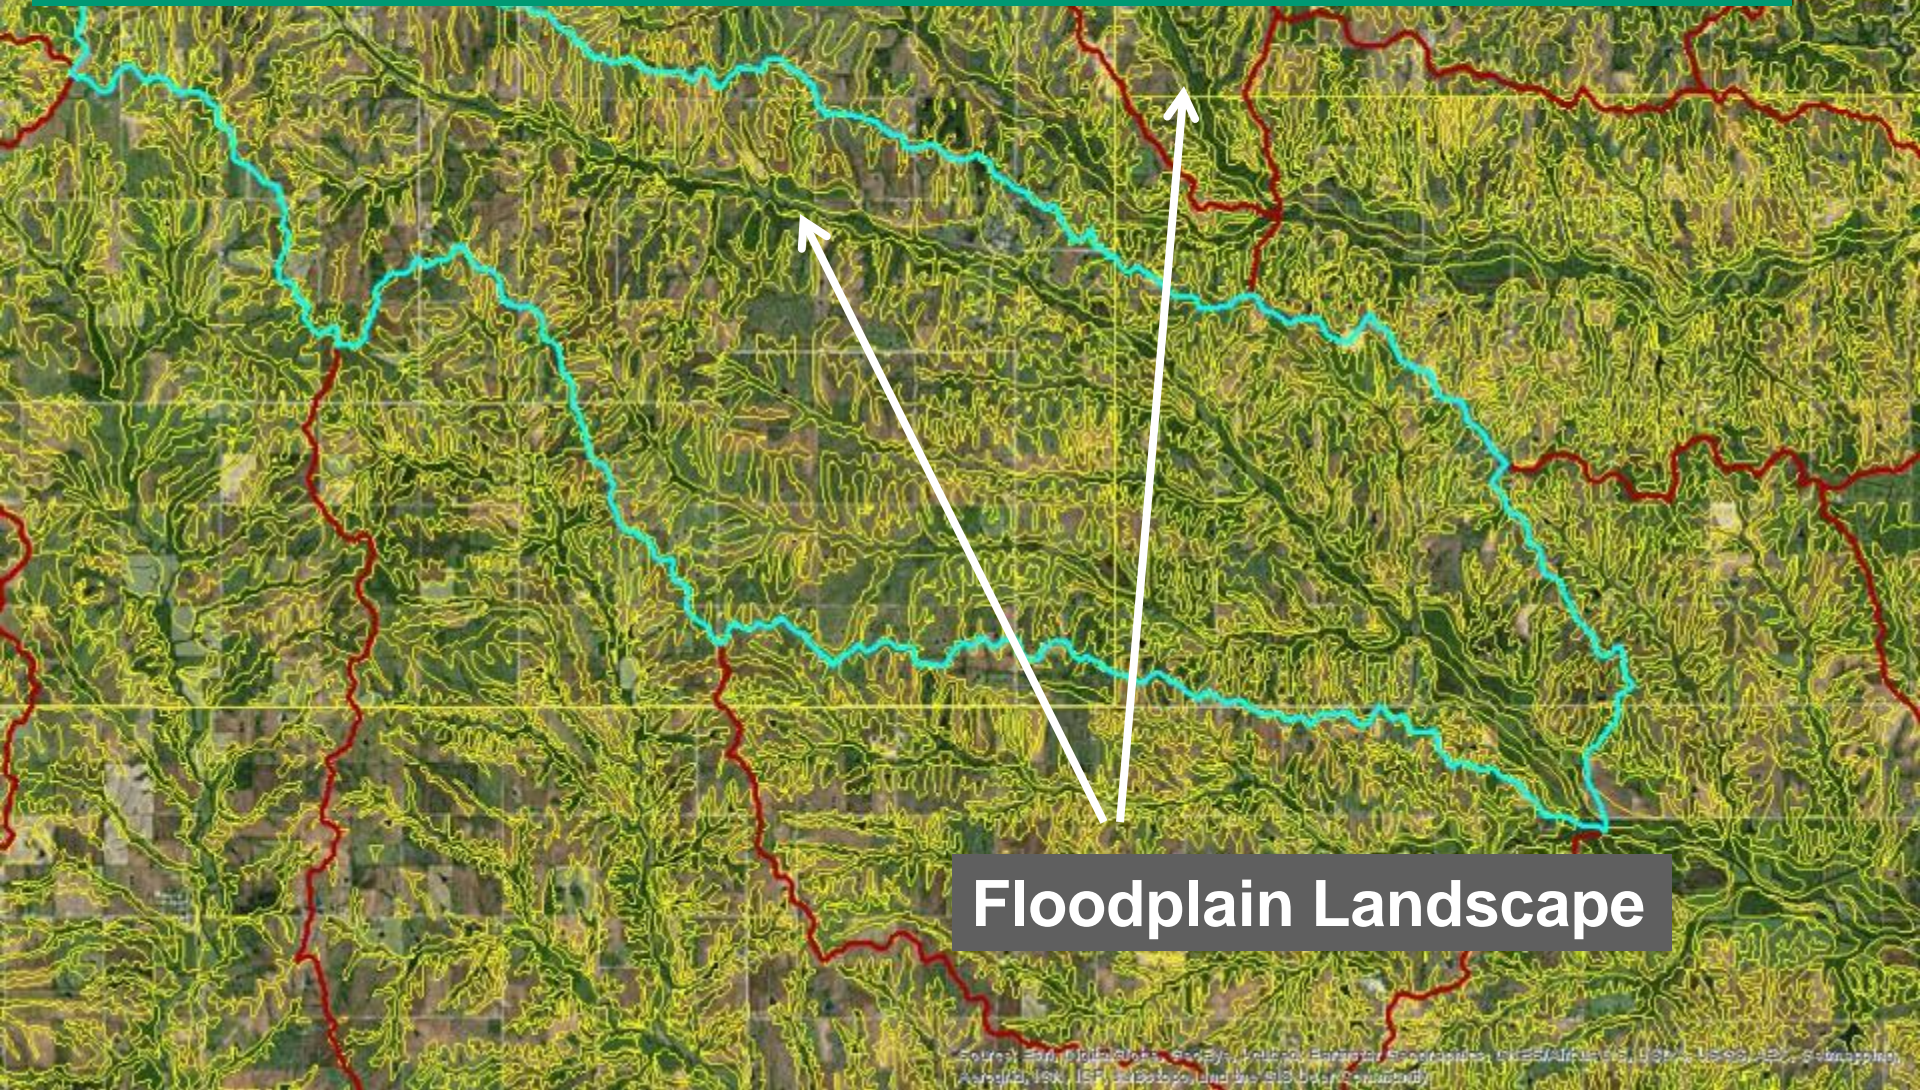

**Map Unit
Aggregation**

HUC-12 in MLRA 103 Northeast Kansas

- “Headwater” HUC
- Similar to other Headwater HUC in MLRA 103
“Reference Domain”

Same Map Units Correlate to Similar Landscapes in Adjacent HUCS (Same MLRA)

Floodplain Landscape

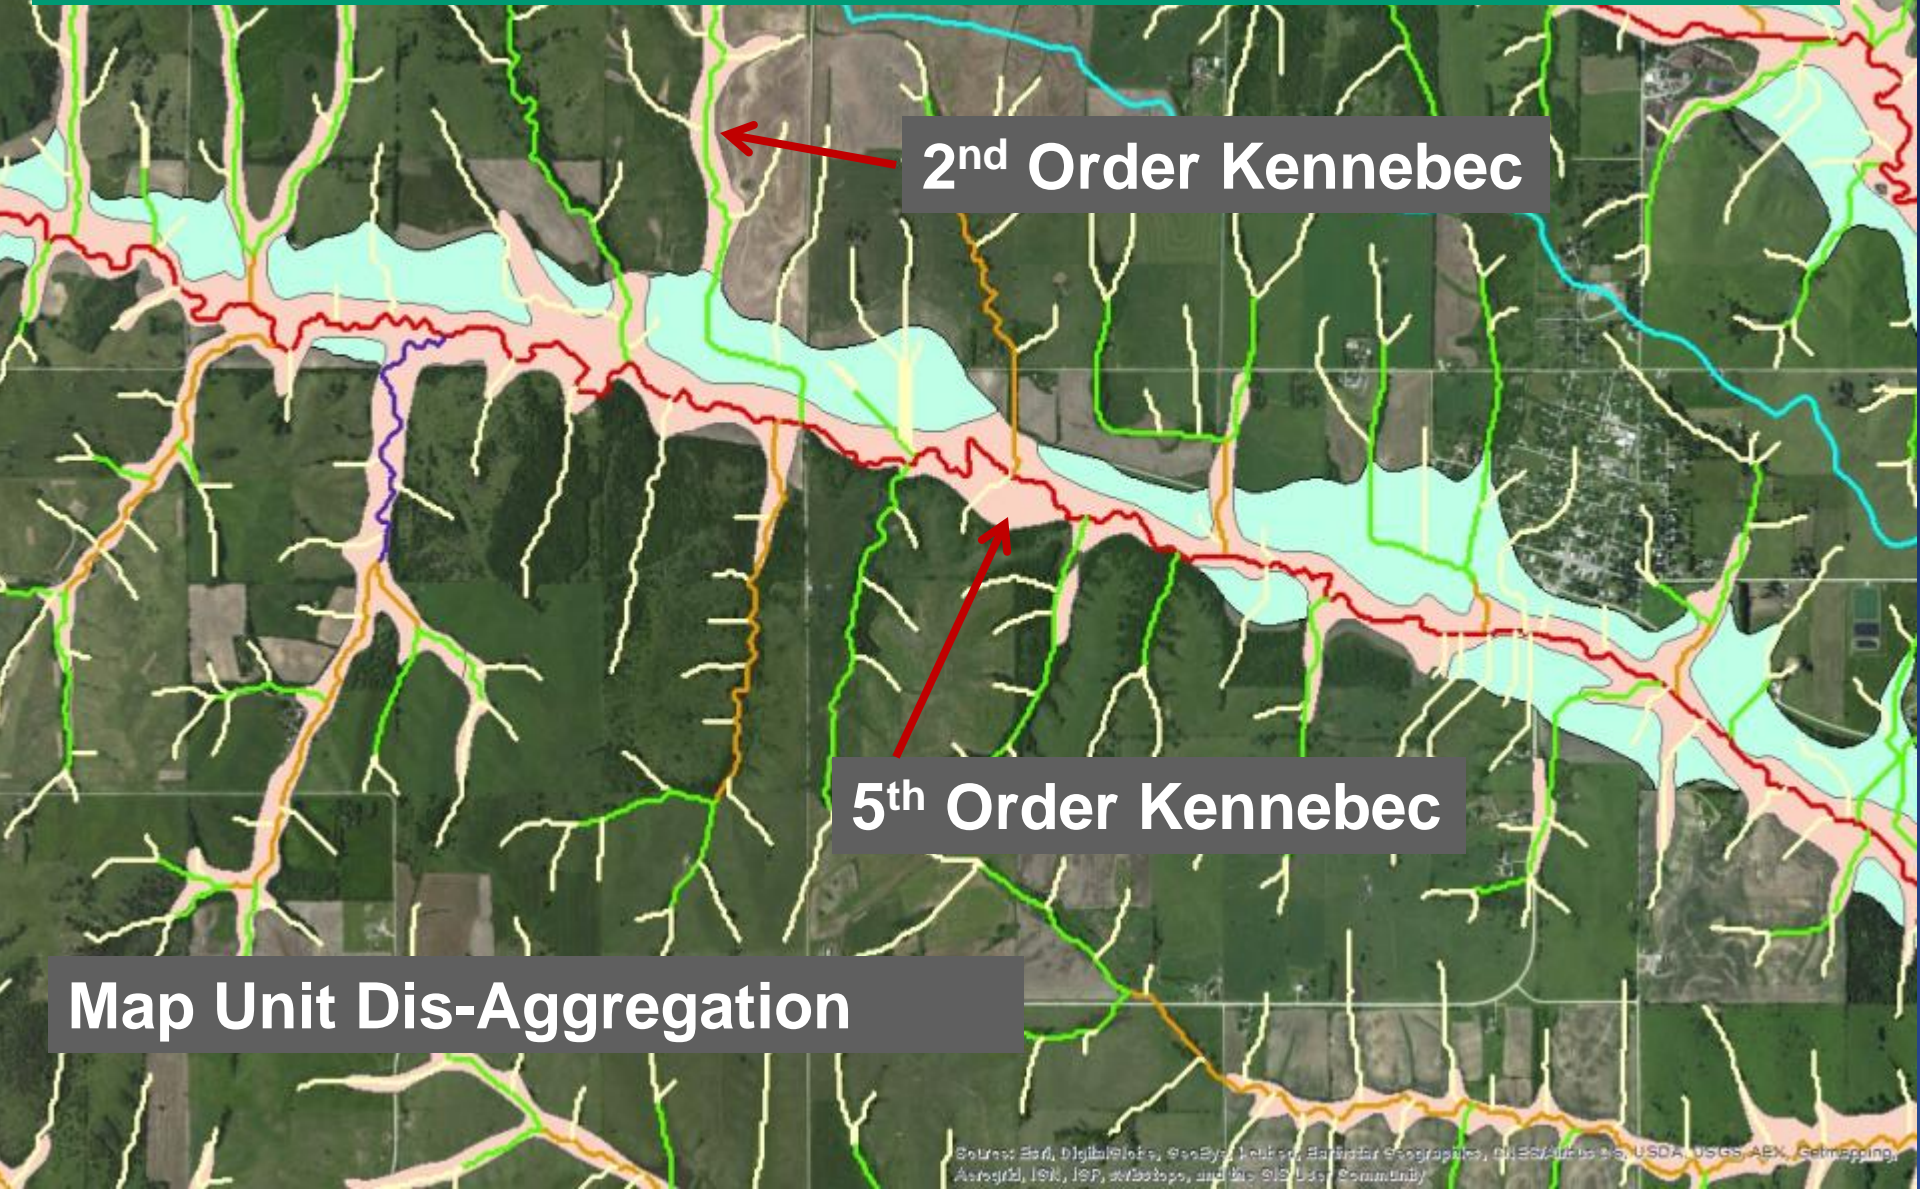

Landscape Boundaries - RIVERINE

Wabash
Occasionally Flooded
Poorly Drained
Backswamp?

Kennebec
Moderately Well Drained
Occasionally Flooded
Natural Levee?

Problem! – Stream Functions Vary with Scale

2nd Order Kennebec

5th Order Kennebec

Map Unit Dis-Aggregation

RIVERINE – Dominant Water Source – Stream Hydrograph

SSURGO

Water

Features

- Flooding
- Ponding
- Groundwater

USGS 06298000 TONGUE RIVER NEAR DAYTON, WY

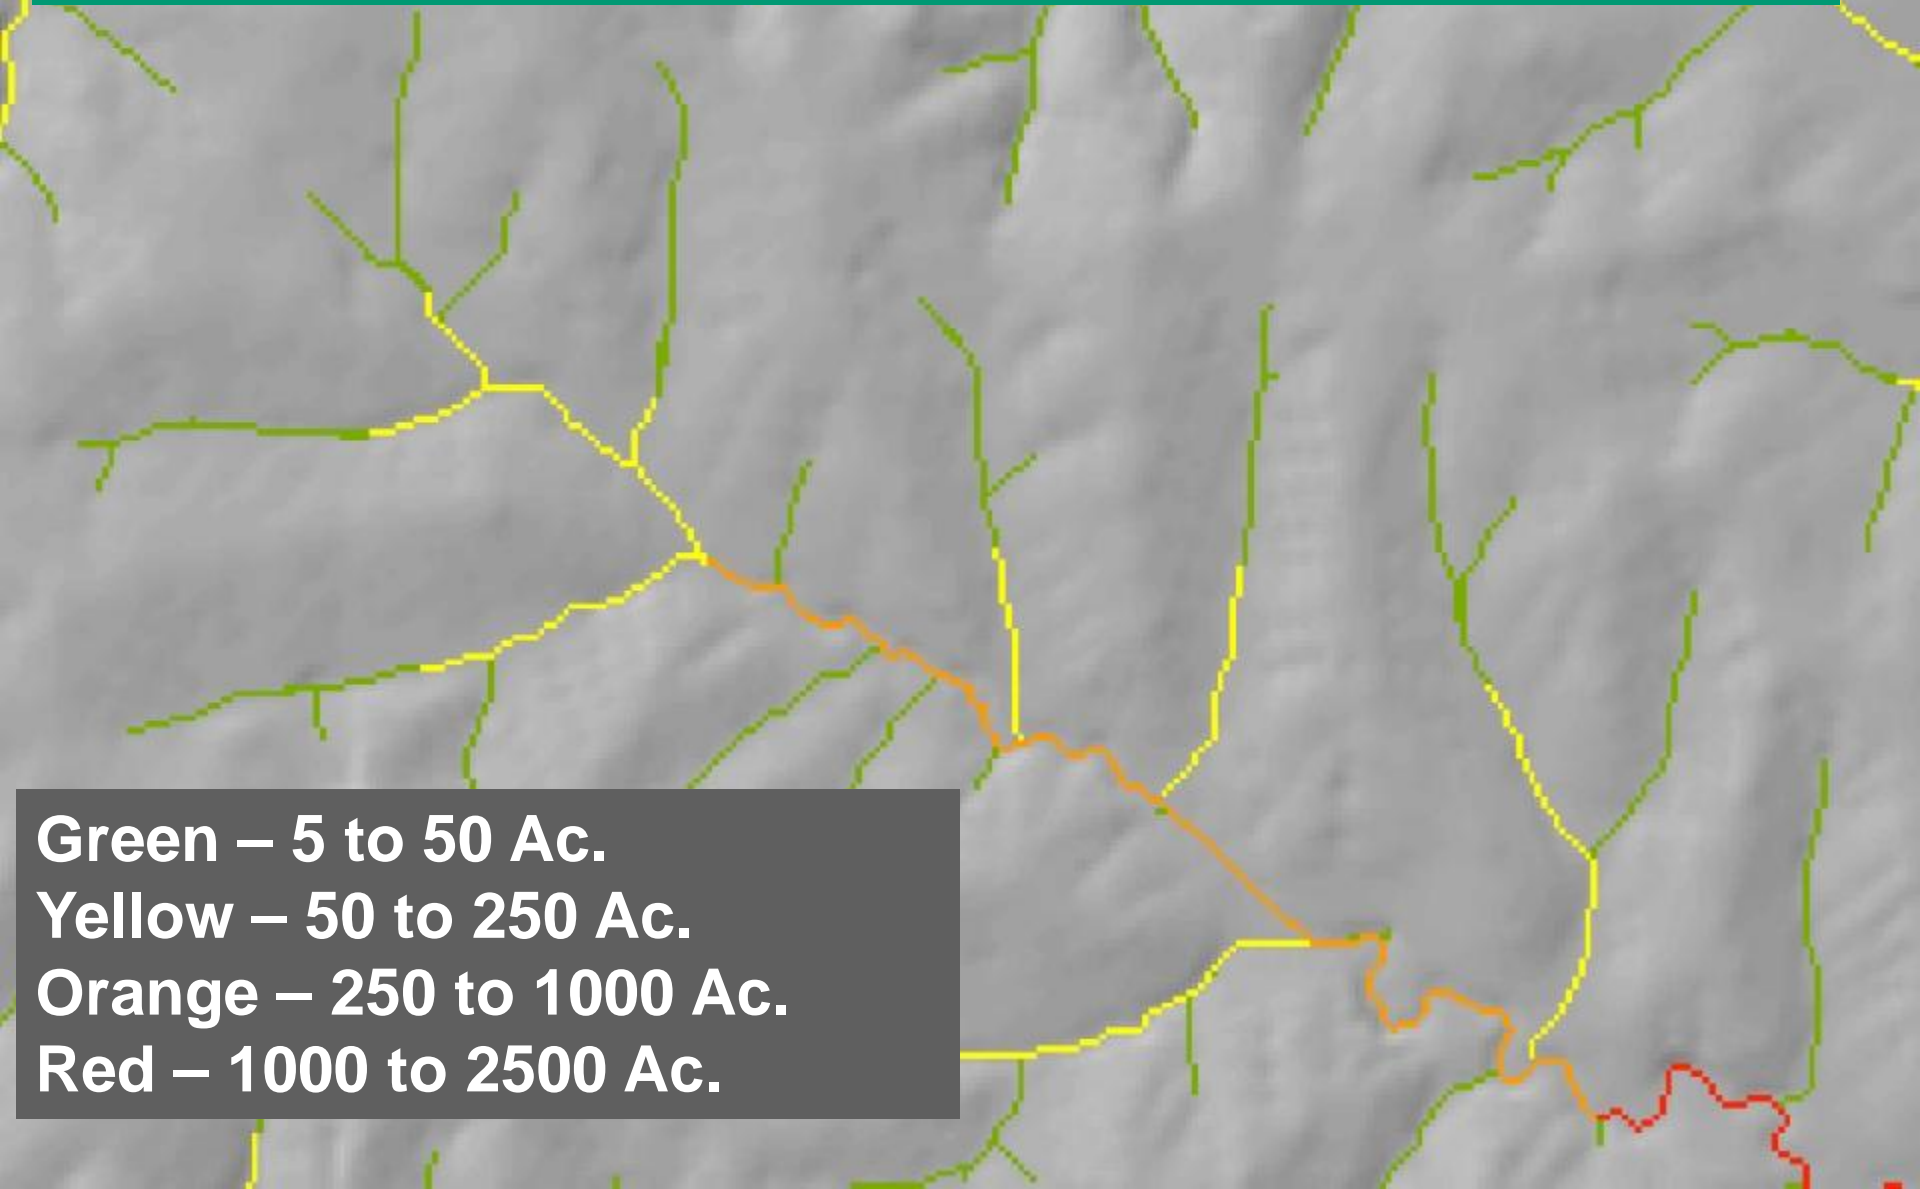

RIVERINE – Surface
Flooding

RIVERINE Soil System

- One Complex Site?
- Several Simple Sites?

Stratification by Scale – Flow Accumulation

Green – 5 to 50 Ac.

Yellow – 50 to 250 Ac.

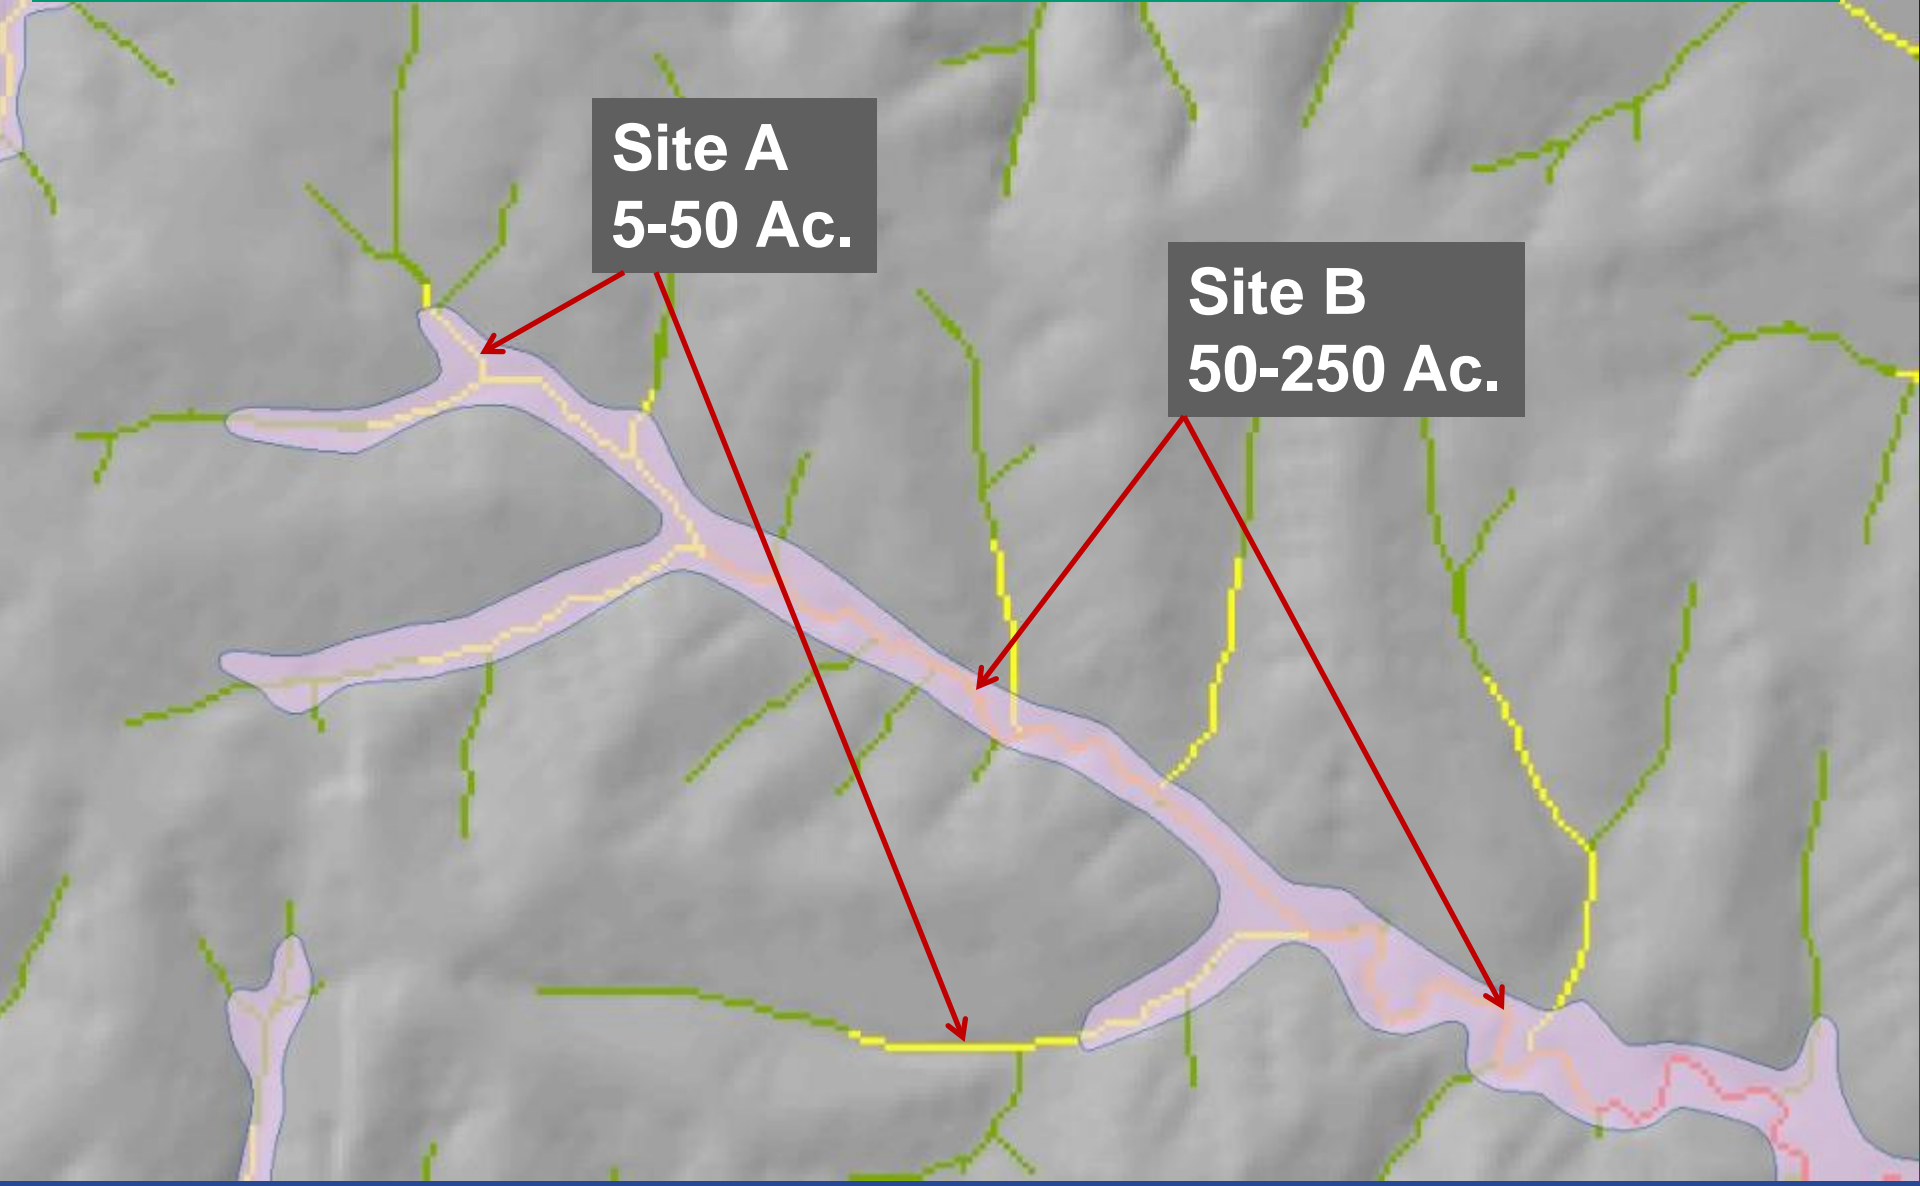

Orange – 250 to 1000 Ac.

Red – 1000 to 2500 Ac.

Map Unit Disaggregation by Scale

Site A
5-50 Ac.

Site B
50-250 Ac.

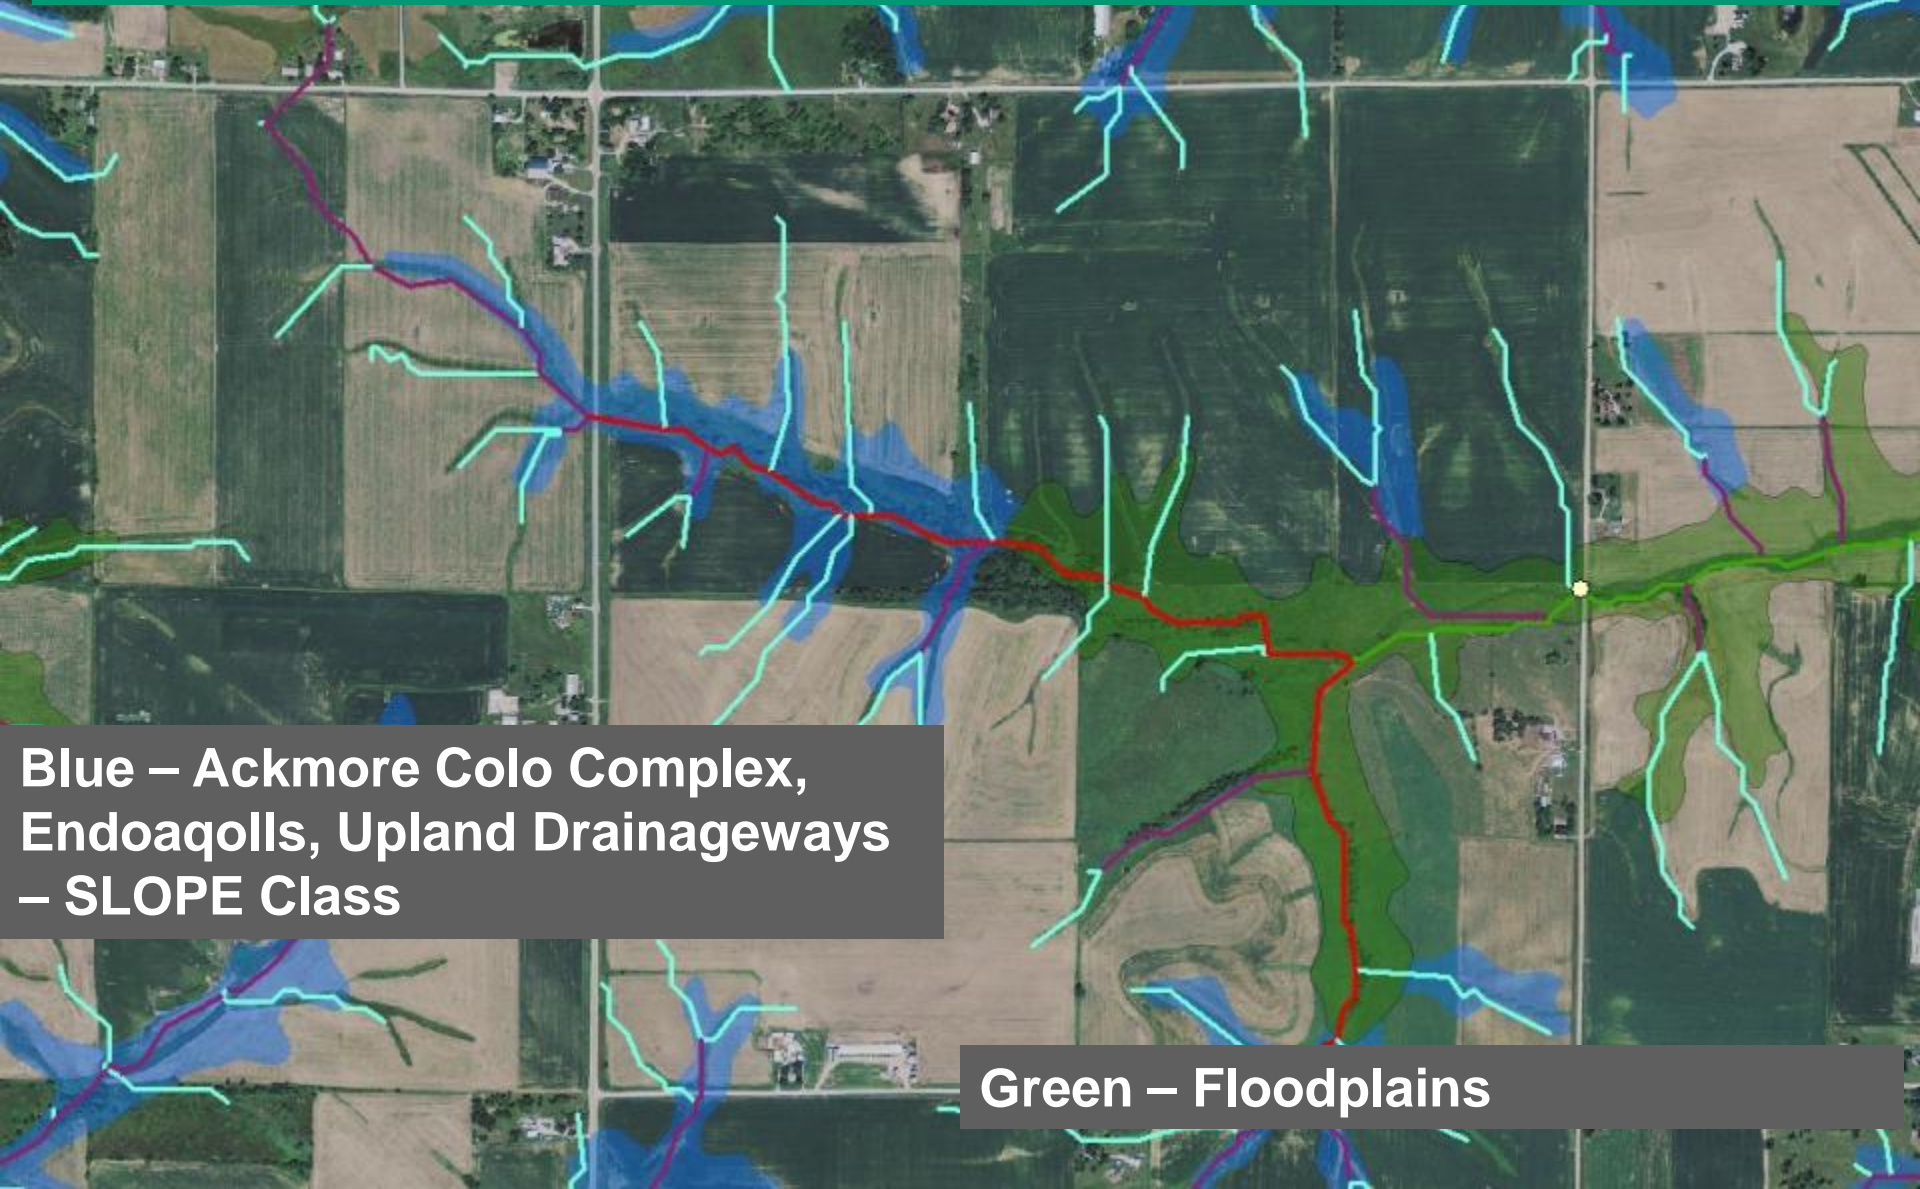

SLOPE – Headwater Reaches

- Dominant Water Source – Groundwater
- No geomorphic Channel
- Vegetated

Landscape Functional Break: SLOPE to RIVERINE HGM Class

**Blue – Ackmore Colo Complex,
Endoaqolls, Upland Drainageways
– SLOPE Class**

Green – Floodplains

SLOPE Wetlands – Unique Functions

Kansas Headwater

Idaho Headwater Fen

New York Headwater Fen

- Aquifer Storage/groundwater discharge
- Sequestration of Organic Carbon
- Critical Upland Water Sources
- Downstream Baseflow Maintenance

SLOPE Wetland Before "Restoration"

SLOPE Wetland After "Restoration"

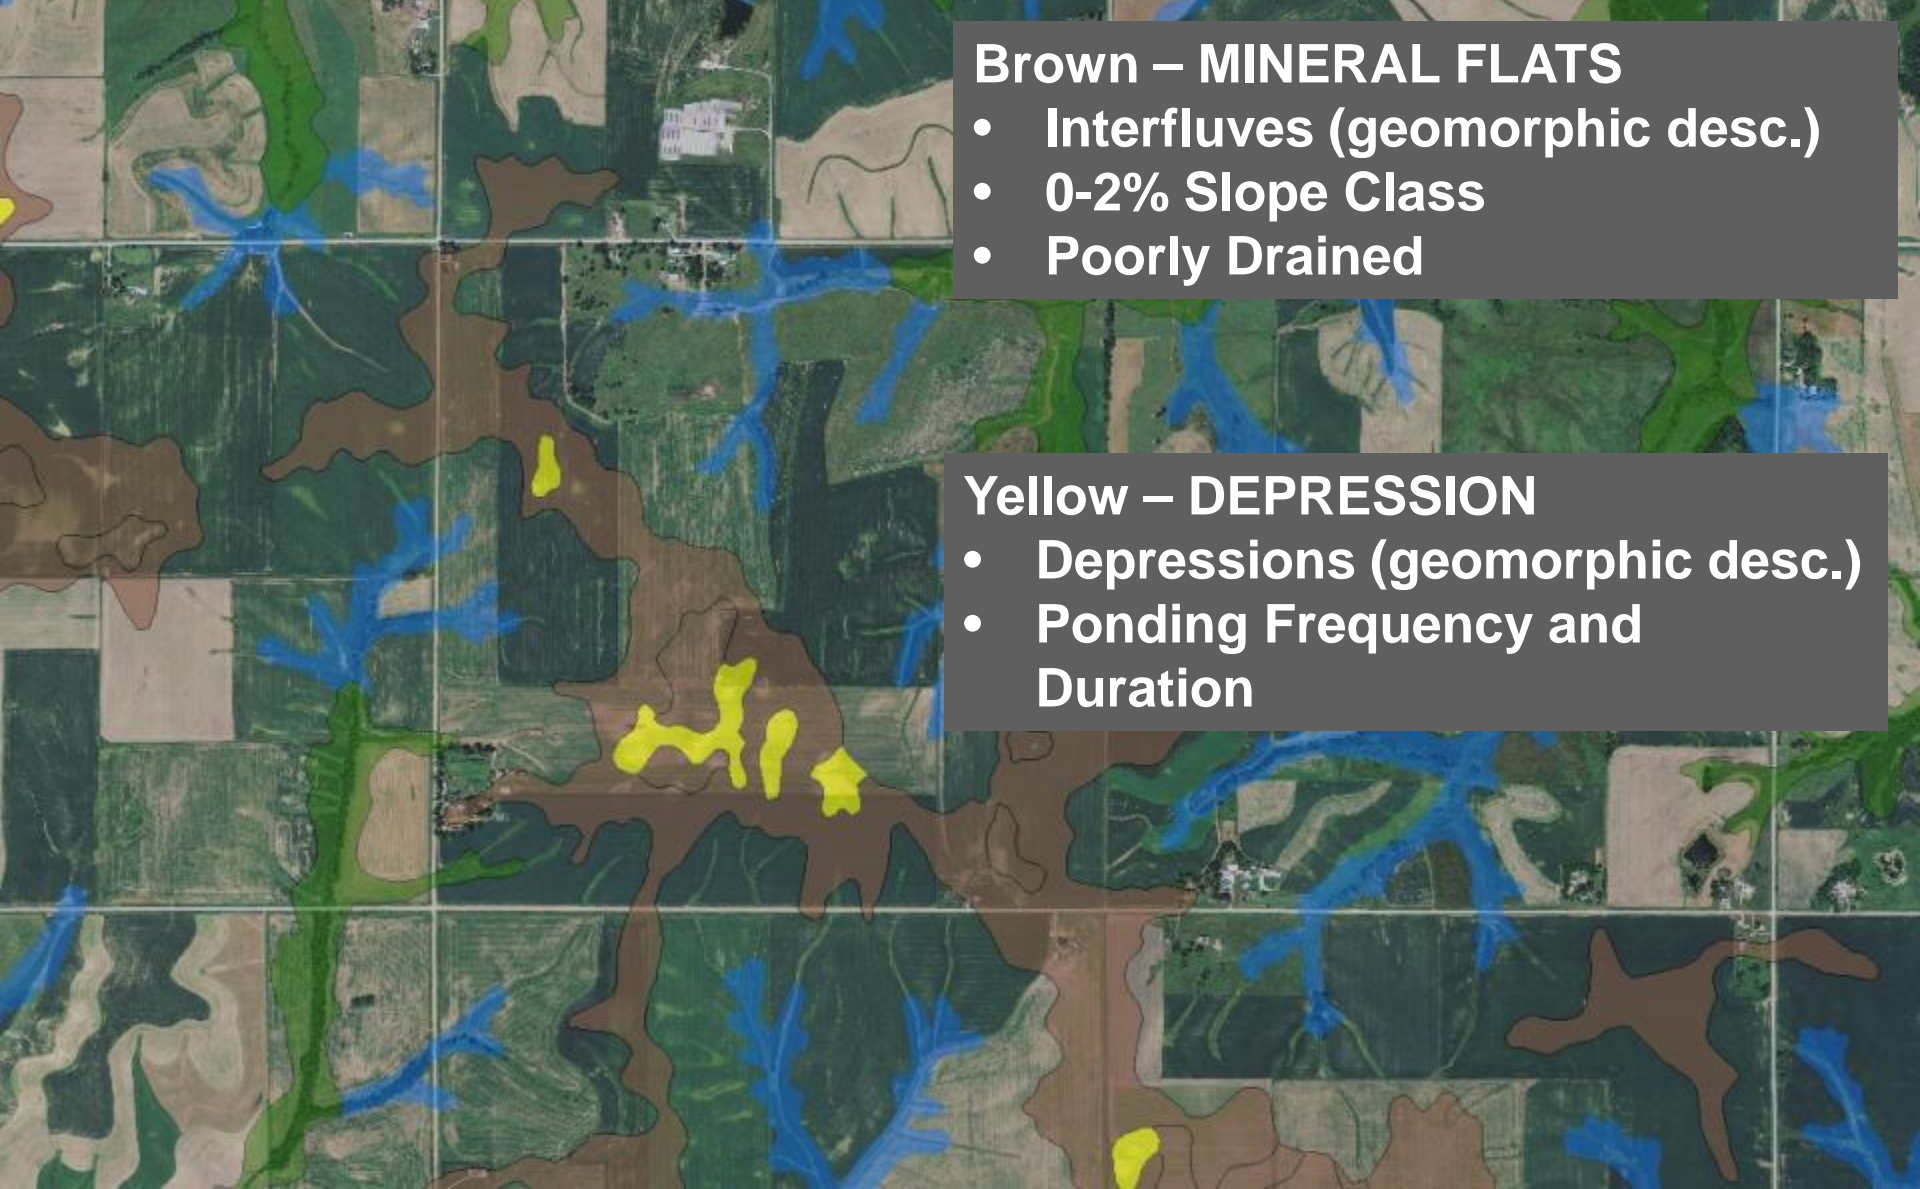

MINERAL FLAT and DEPRESSION

Brown – MINERAL FLATS

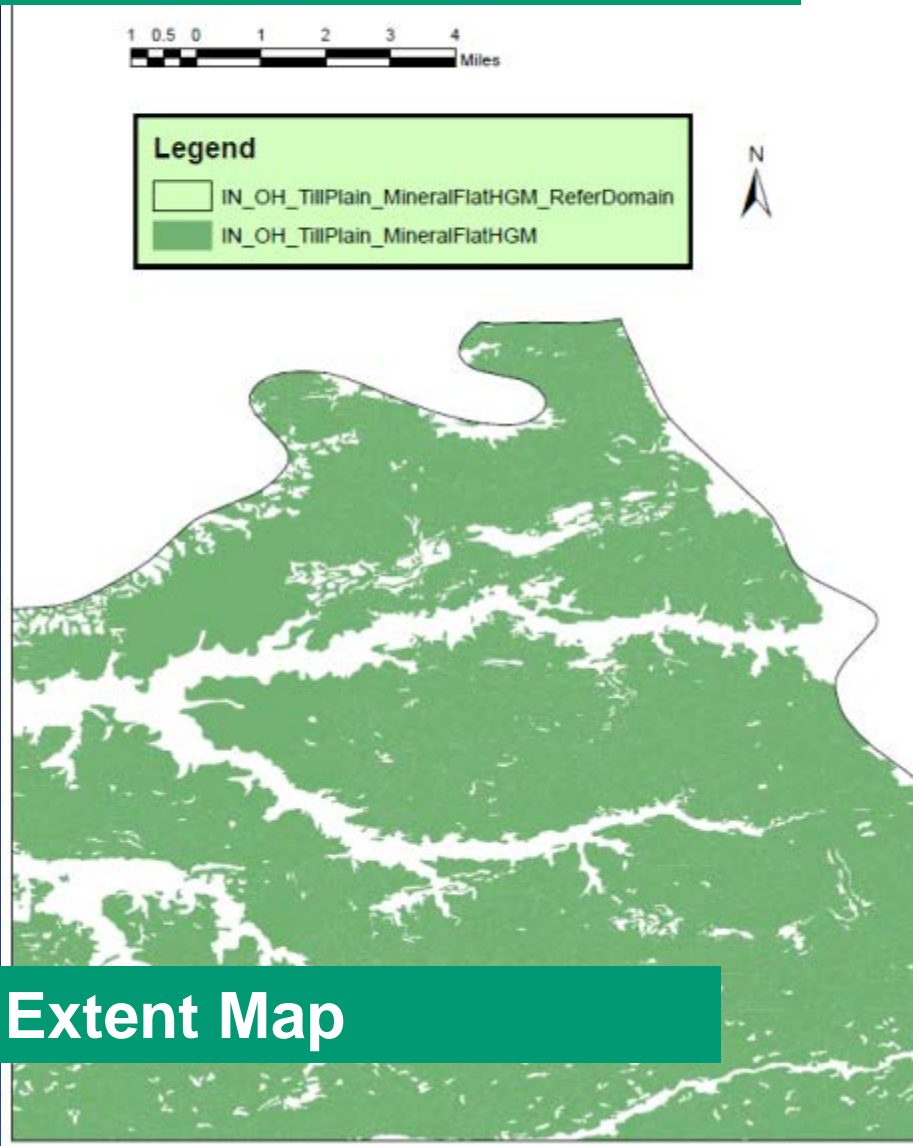

- Interfluves (geomorphic desc.)
- 0-2% Slope Class
- Poorly Drained

Yellow – DEPRESSION

- Depressions (geomorphic desc.)
- Ponding Frequency and Duration

Landscape Mapping - Mineral Flats

Extent Map

By definition:

- Below Flow Accumulation Threshold
- Outside the Watershed Network

Headwater SLOPE

Wayne County, Iowa

Yellow Reaches – Slope
Green, Purple Polygons –
Mineral Flats

Stratigraphic SLOPE

Lucas County, Iowa

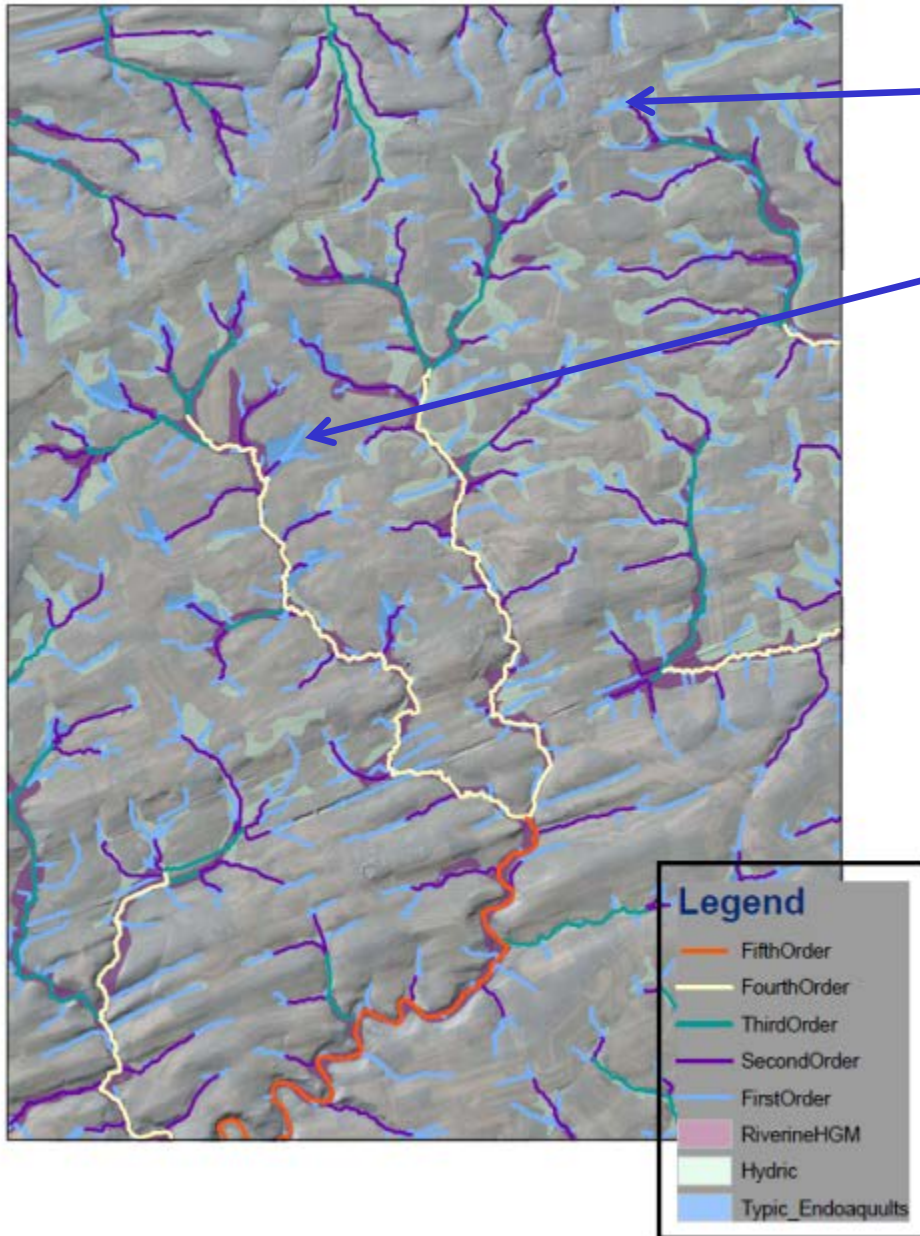

Yellow Reaches - Slope

Green, Reaches - Mineral Flats

Red - Stratigraphic SLOPE

Lancaster County
HGM Class Map

Potential Bog Turtle Habitat

“Typic Endoaquils

Groundwater
Dominated Soils
In Low Stream Order
Landscapes

MINERAL SOIL FLAT

Dominant Water Source-
Direct Precipitation

DEPRESSIONAL

Nebraska Rainwater Basin –
Recharge Depression

Wyoming – Recharge
Depression, Gillette

South Dakota
Prairie Pothole

South Carolina – Carolina Bay

DEPRESSIONAL

Dominant Water Source – Surface Runoff and/or Groundwater

Texas Playas –
Recharge

Randall Clay

**Depressional-
Default if not found
on other HGM class**

South Dakota Prairie
Potholes –
Recharge, Discharge,
and Flowthrough

Extent Map Issues

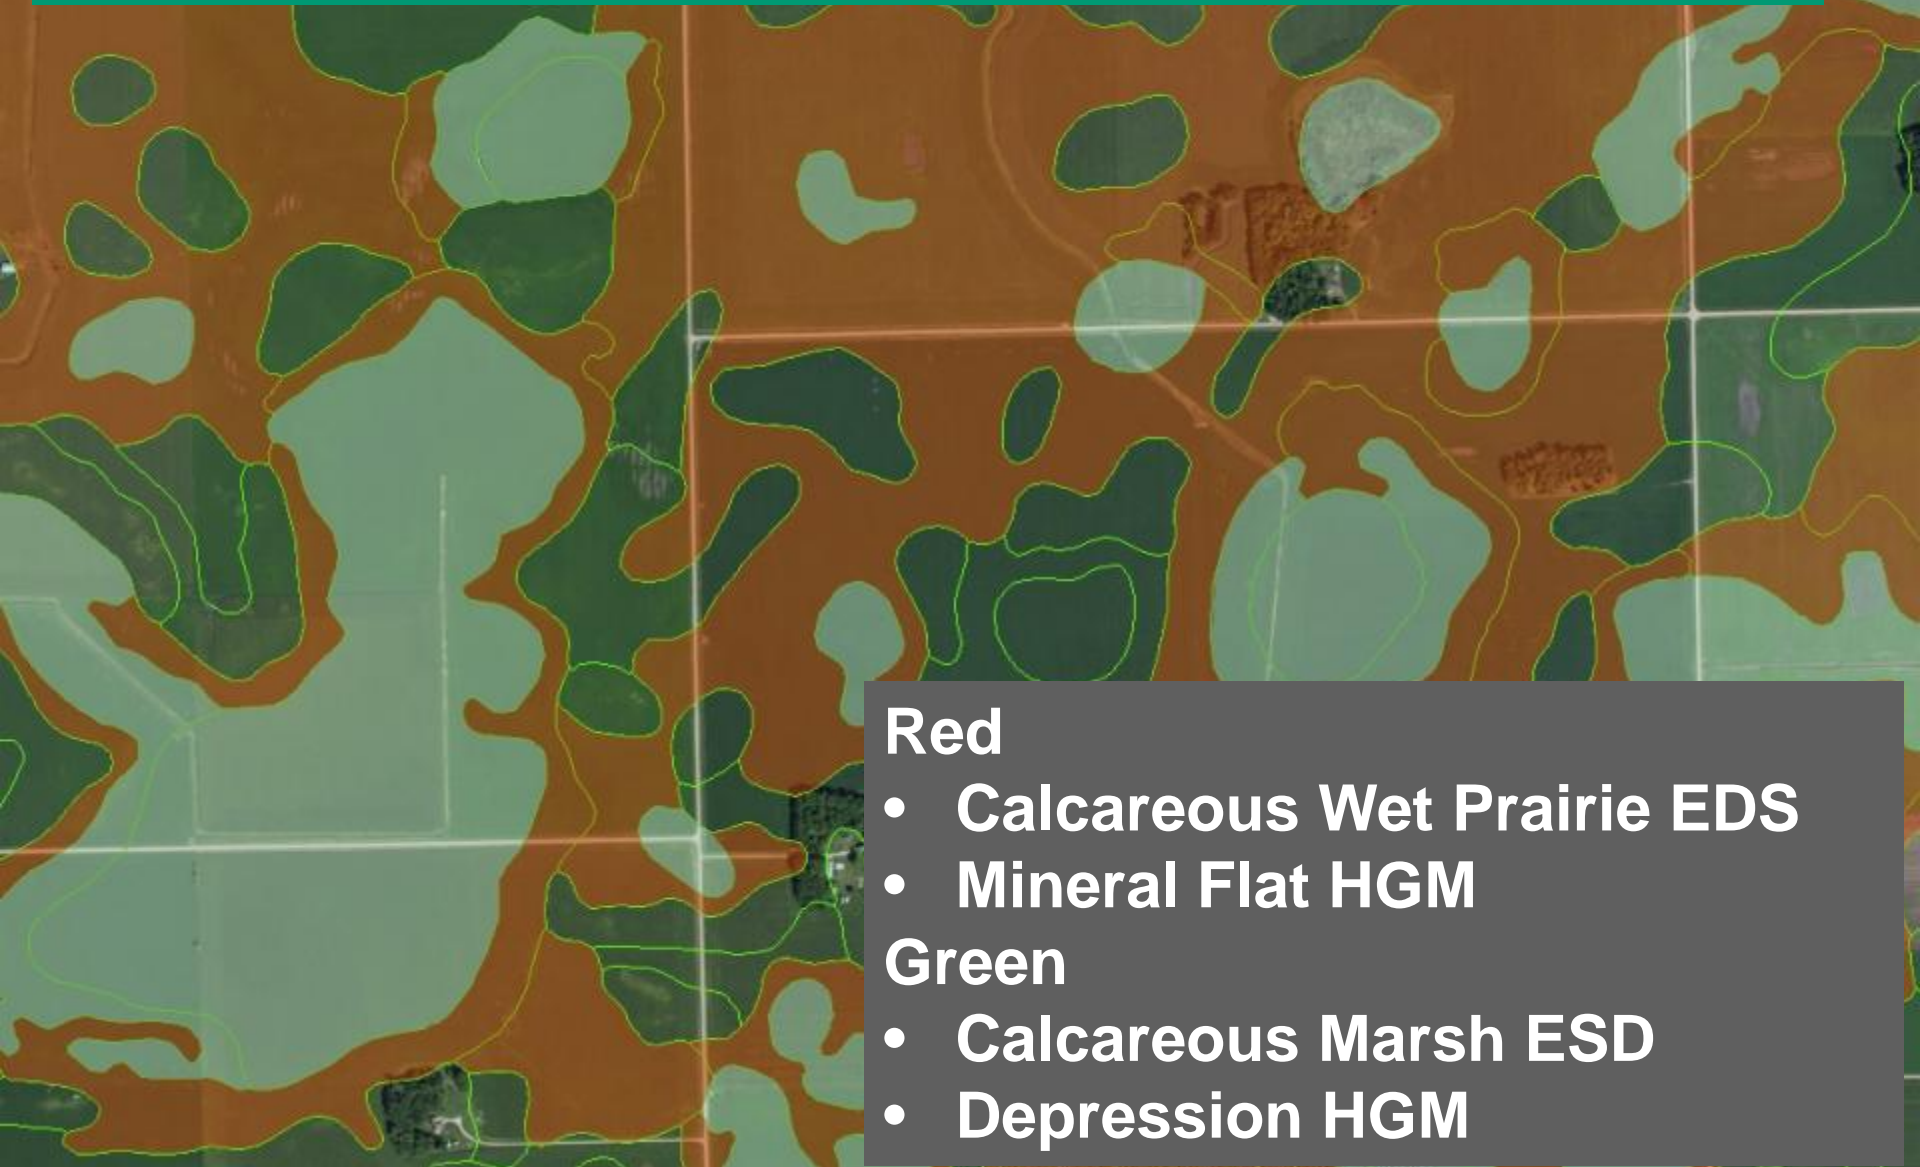

- Soil Mapping on County Scope
- Attributes are not Always Consistent

Ecological Site Extent Map of:

- **Calcareous Marsh**
- **Calcareous Wet Prairie**

Only Map Units Used

Sub Map Project Extent (County)

Red

- Calcareous Wet Prairie EDS
- Mineral Flat HGM

Green

- Calcareous Marsh ESD
- Depression HGM

Generalized Landscape Map

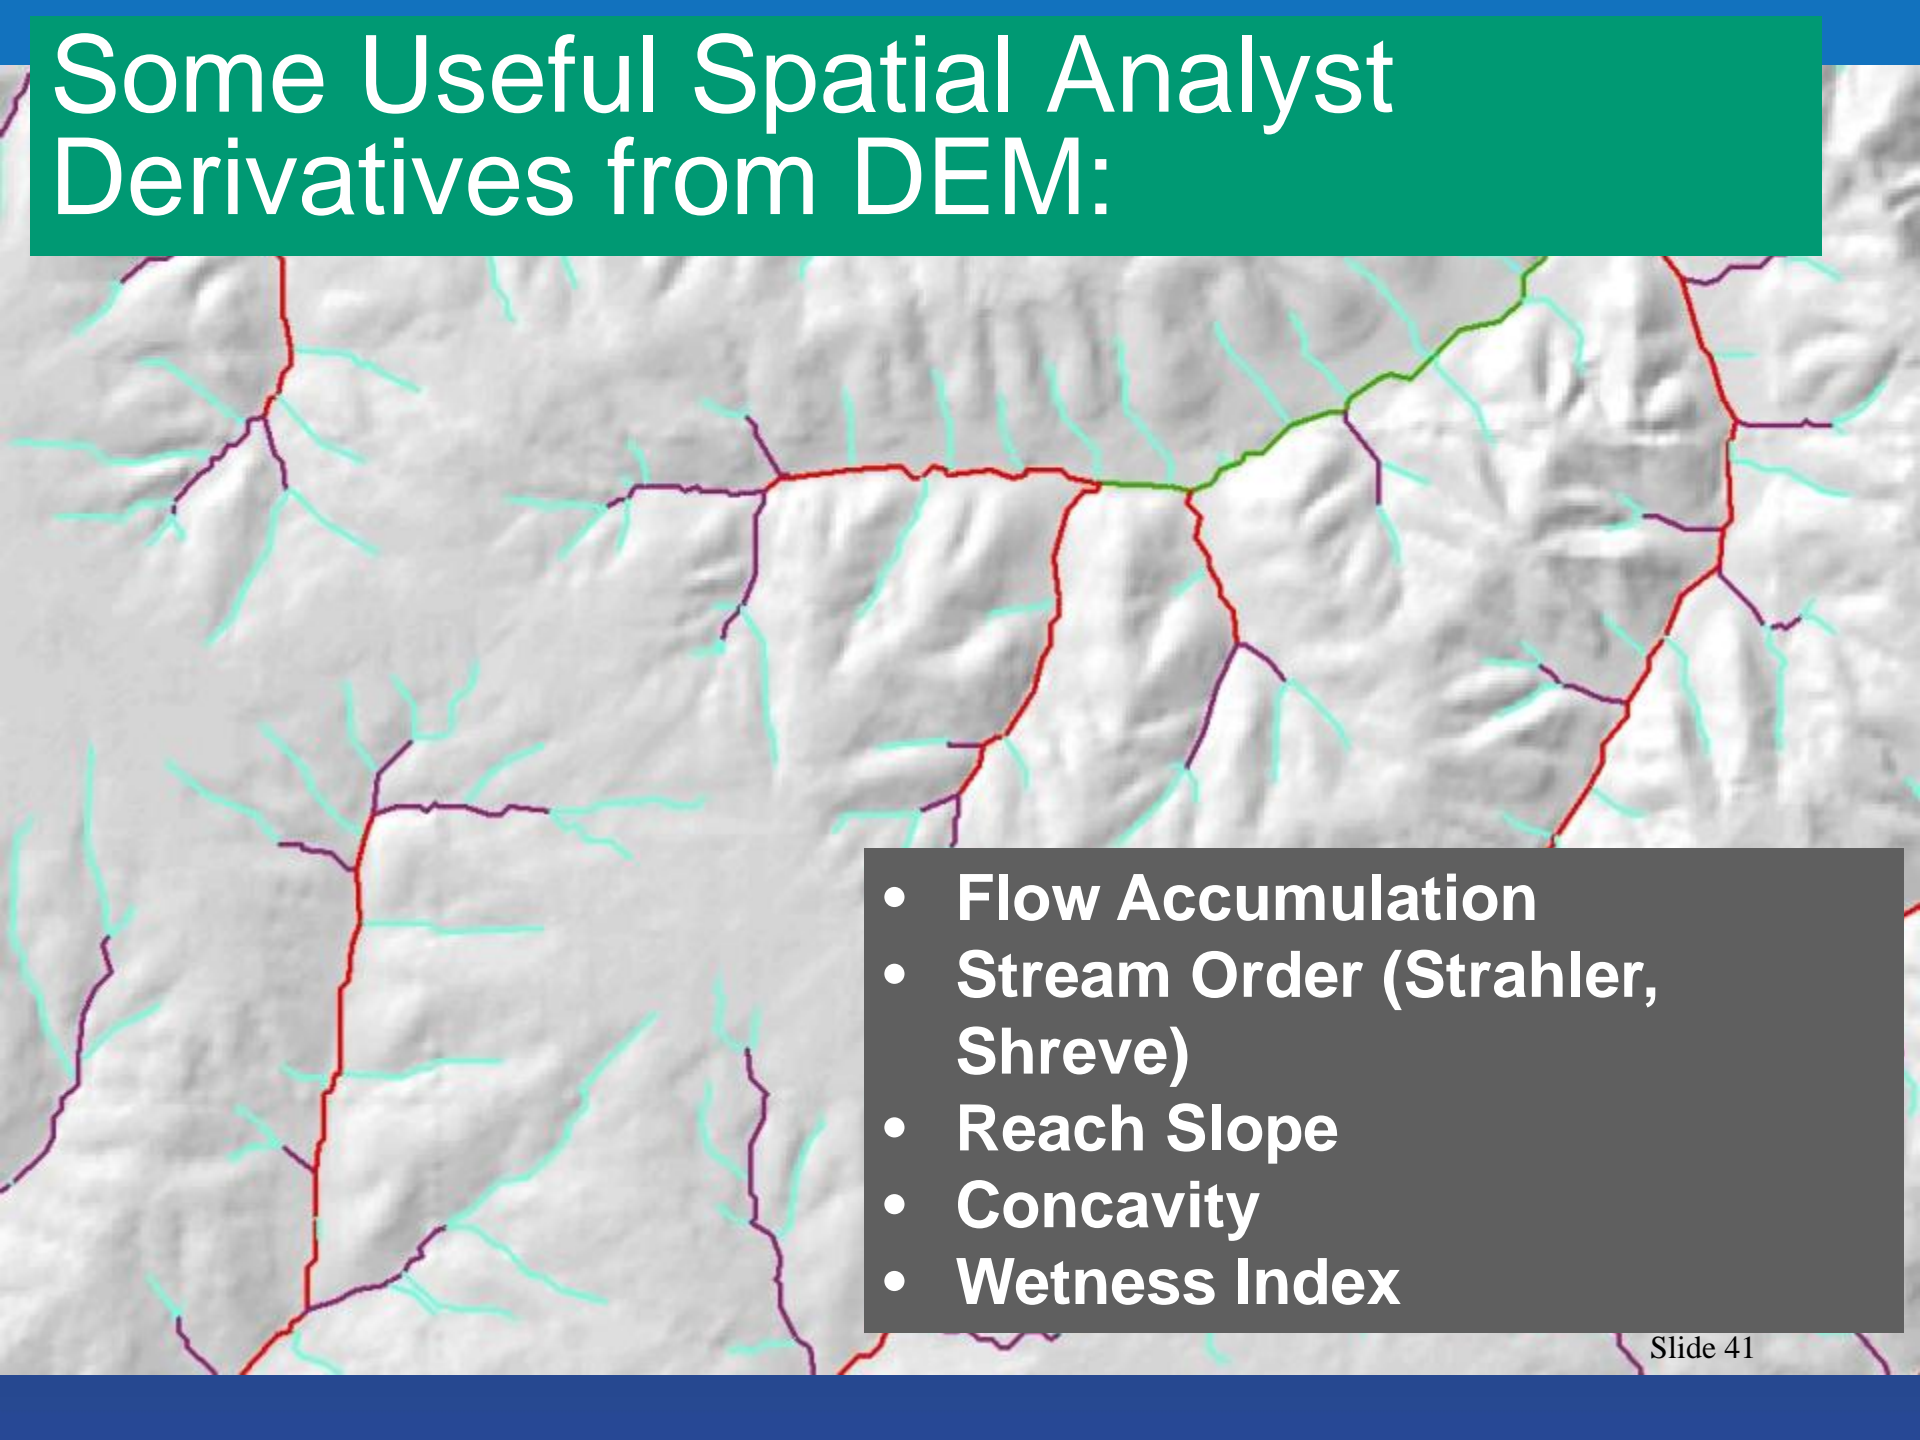

Some Useful Soil Attributes from SSURGO:

- **Geomorphic Description**
- **Drainage Class**
- **Slope Class**
- **Taxonomy**
- **Water Features**
 - **Flooding Freq. and Dur.**
 - **Ponding Freq. and Dur.**
 - **Groundwater Depths**

Useful Database Tables:

- **Component**
- **Map Unit**
- **Map Unit Aggregated Attributes (muaggat)**

Some Useful Spatial Analyst Derivatives from DEM:

- 
- Flow Accumulation
 - Stream Order (Strahler, Shreve)
 - Reach Slope
 - Concavity
 - Wetness Index

The Vision:

- **Use the best of “Worldwide” Classification Systems for Landscapes, Streams, Wetlands, Etc.**
 - Cowardin
 - Rosgen
- **Use Existing Spatial Definitions for Land as Part of the Local Classification**
 - HGM Subclass
 - Ecological Site
- **Description Includes**
 - Where it's at – MLRA
 - Spatial Context – Flow Accumulation, Stream Order
 - What part of the Watershed it Occupies
 - What hydrologic process it performs – recharge, discharge, runoff, runon
 - Extent map

Thanks!
