

Communicating Wetland Spatial Data To Non-Technical Audiences

Association of State Wetland Managers Annual Meeting
March 24, 2015
NCTC, Shepherdstown, WV

How Do You Turn This?

GeoSpatial Services

Into This?

Landscape Level Planning

- Consider all aspects of the landscape natural (primeval), rural and urban
- All should be part of the planning hierarchy because each element defines human experience in the landscape
- Then must consider how human activities (communities, commodity flows, employment and leisure) act to shape these elements
- Planning for wetland preservation, restoration and enhancement should occur within that framework.

Some Lessons Learned

1. Know your audience: level of knowledge, expectations, community issues
2. Use graphics and/or handouts to describe data and techniques
3. Limit explanations of how wetland data is generated. Just enough to convey confidence in the processes
4. Describe information that is available (e.g. GIS layers)
5. Explain how process will assess and refine this (e.g. maps showing restoration opportunities) and explain what it is not

Understanding Expectations

Interviews:

Question 2: When you hear the word “wetland” what pops into your mind?

Question 3: Are you familiar with, or do you use, wetlands in your community? If so, please provide examples.

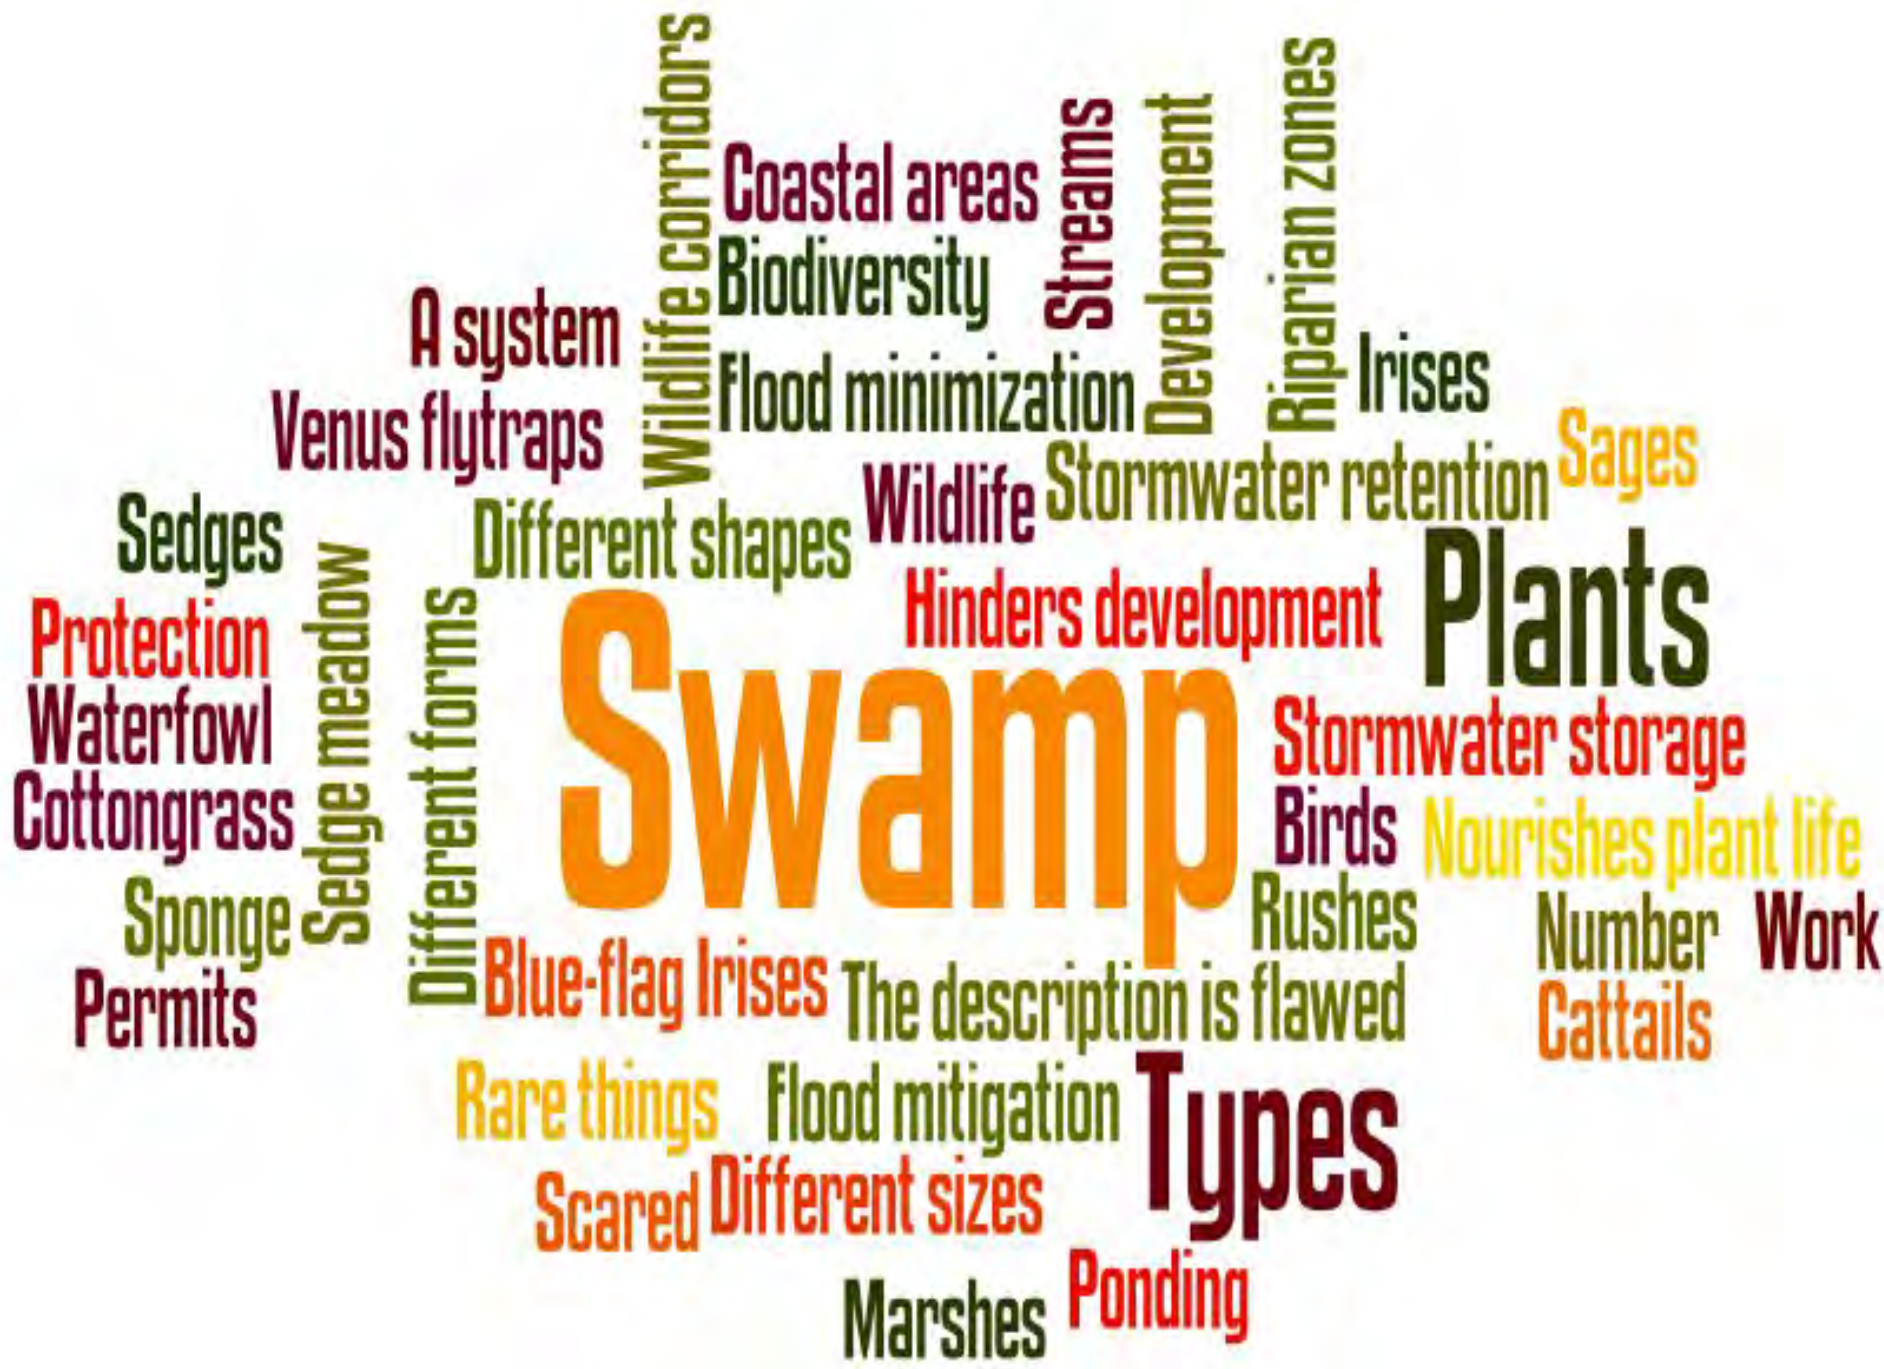

Wetland Ecosystem Services

This project would develop a framework for identifying the services that wetlands provide to communities. This framework would then be used to prioritize areas for future wetland mitigation and restoration projects within watersheds.

Question 4: Would you be interested in learning more about the services wetlands provide in your community?

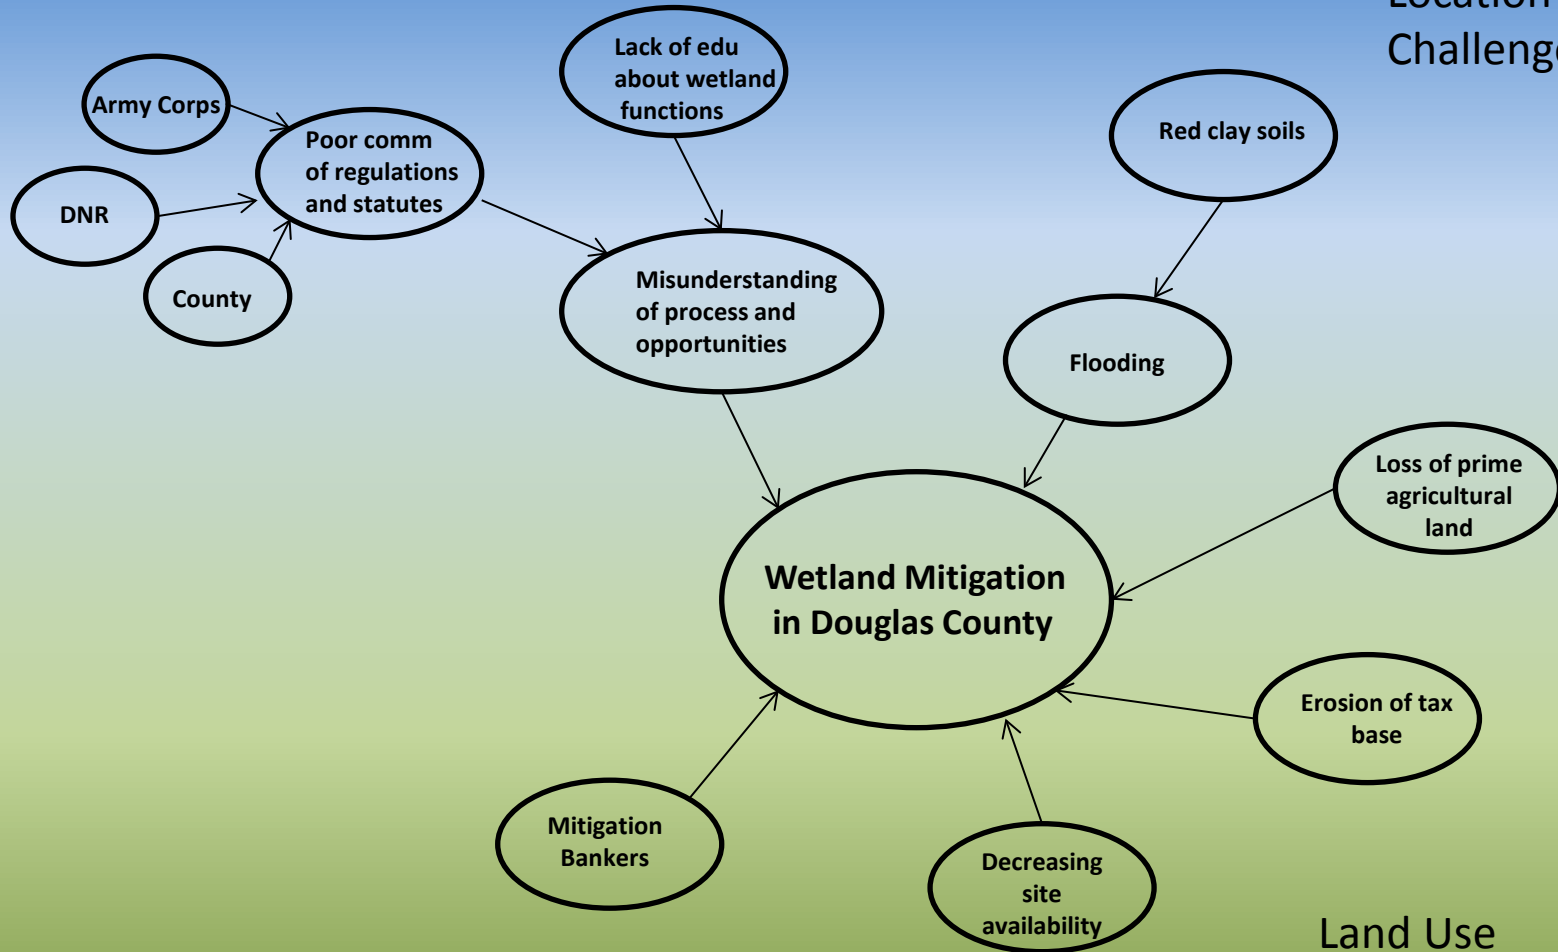

Question 5: Have you (or your community, business, etc.) experienced problems with flooding or storm water runoff recently? If so, please elaborate.

When you hear the word “wetland”
what pops into your mind?

Issues

Location Challenges

Land Use

Simplified PowerPoints

So, what is a watershed anyway?

WATERSHED

What are Wetlands?

Where land and water meet:

- 1) Water – standing, flowing, ponding (hydrology)
- 2) Soils – saturated, wet, mucky, peat organic (hydric)
- 3) Vegetation - adapted to wet conditions (hydrophytic)

What do Wetlands Look Like?

**Wetlands are
not just this**

**They vary in
size, type &
appearance**

What do Wetlands Look Like?

Marsh

Fen

Sedge Meadow

Low Prairie

Alder Thicket

Open Bog

Ephemeral Pond

Shrub Carr

Coniferous Bog

Coniferous Swamp

Floodplain Forest

Lowland Hardwood Swamp

List of Wetland Functions

- ✓ Plant Diversity
- ✓ Fish and Wildlife Habitat
- ✓ Flood/Stormwater Management
- ✓ Water Quality Improvement
- ✓ Shoreline Protection
- ✓ Groundwater Recharge/Discharge
- ✓ Aesthetics/Recreation/Education

Many watershed problems are linked to large scale changes in how water & other materials move across the landscape.

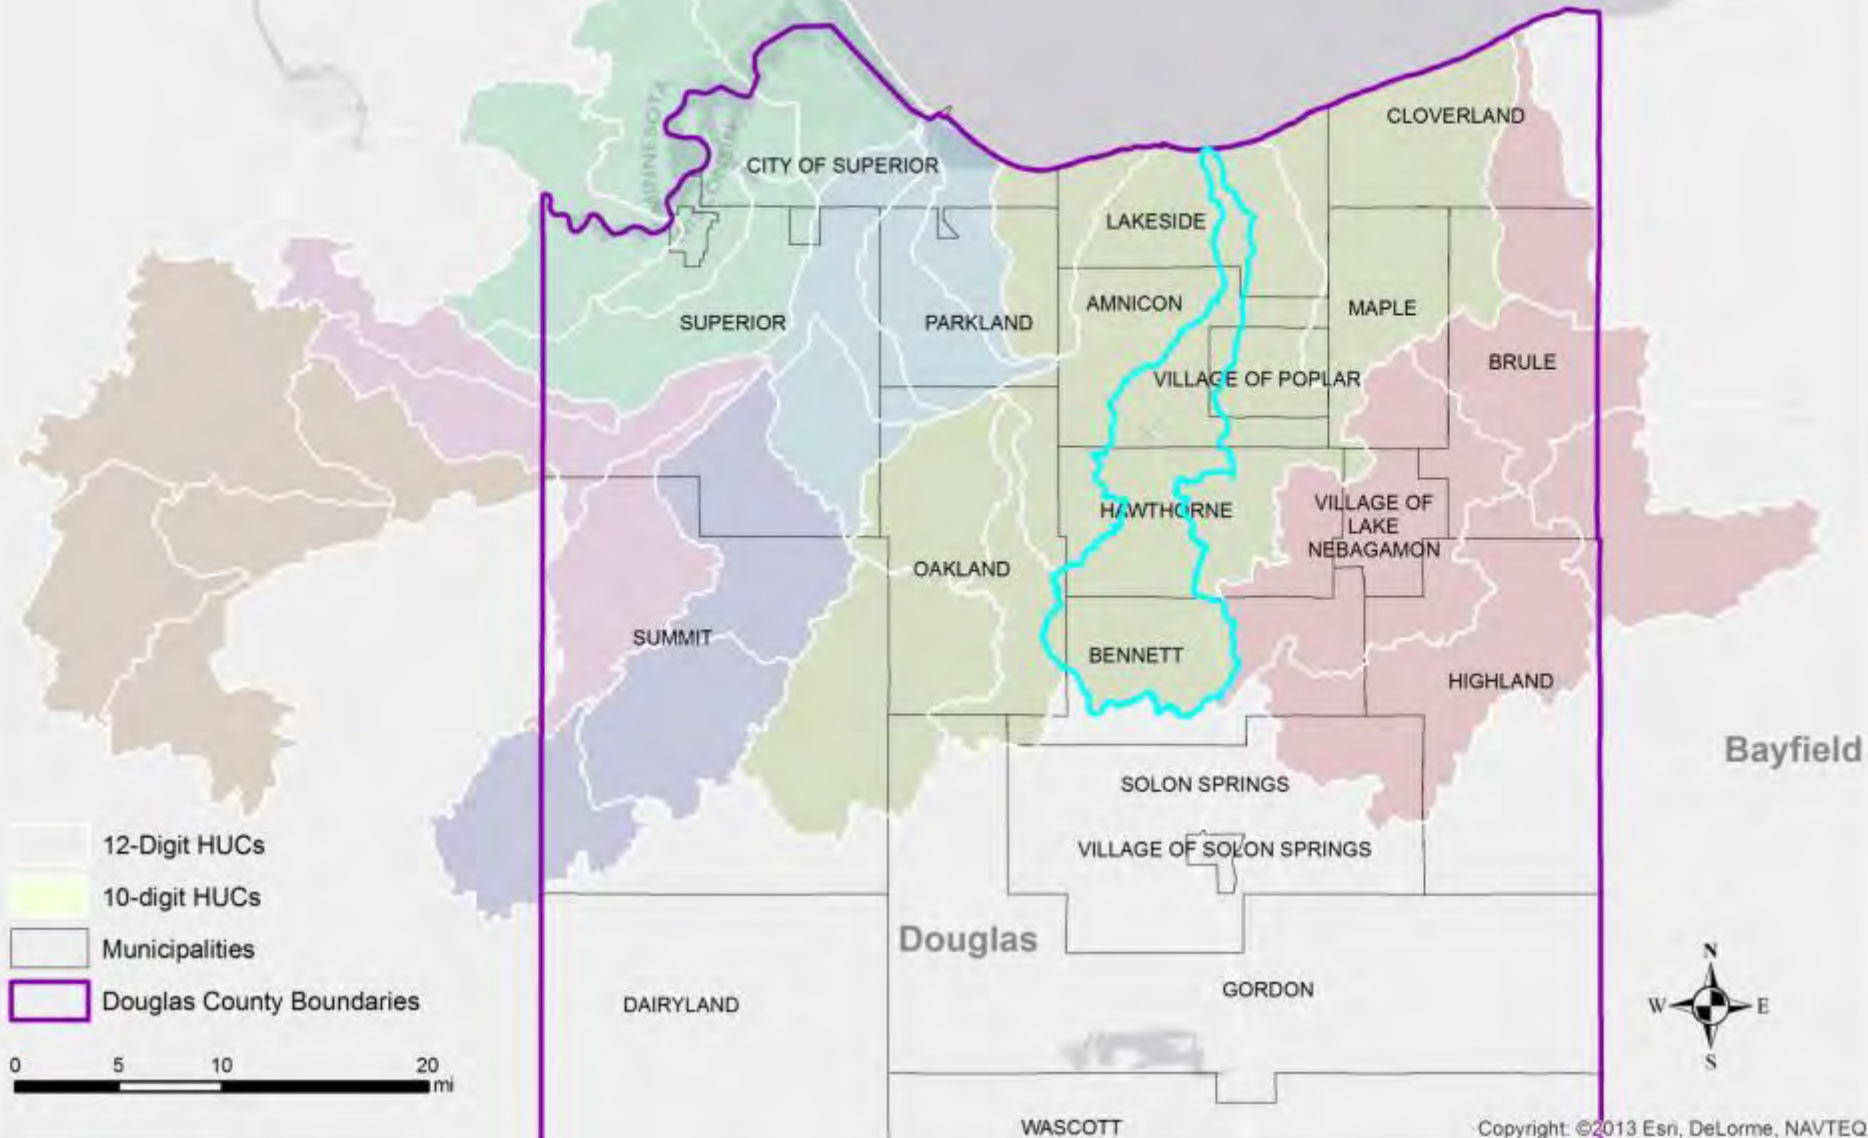

Severe storms are on the rise.

Surface Water Detention (SWD)

Meaningful Analysis

Wetland Benefits

- **Water Quality Protection**
Wetlands filter sediment and nutrients from stormwater.

- **Flood Damage Prevention**
Wetlands reduce flood impacts by holding and slowly releasing runoff from rain and snowmelt.

- **Wildlife Habitat**
Wetlands provide critical habitat for birds, fish, turtles, mammals and reptiles.

This brochure was created by the Van Buren Conservation District as part of the Paw Paw and Black Rivers Wetland Protection & Restoration Project with support from the Michigan Department of Natural Resources and Environment, the Two Rivers Coalition, the Southwest Michigan Land Conservancy and Ducks Unlimited.

Michigan's
Nonpoint Source
Program

This Nonpoint Source Pollution Control project has been funded wholly through the Michigan Nonpoint Source Program by the United States Environmental Protection Agency under assistance agreement C5978474-10 to the Van Buren Conservation District for the Paw Paw & Black Rivers Wetland Protection & Restoration project. The contents of the document do not necessarily reflect the views and policies of the EPA, nor does the mention of trade names or commercial products constitute endorsement or recommendation for use.

Landscape Level Wetland Functional Assessment

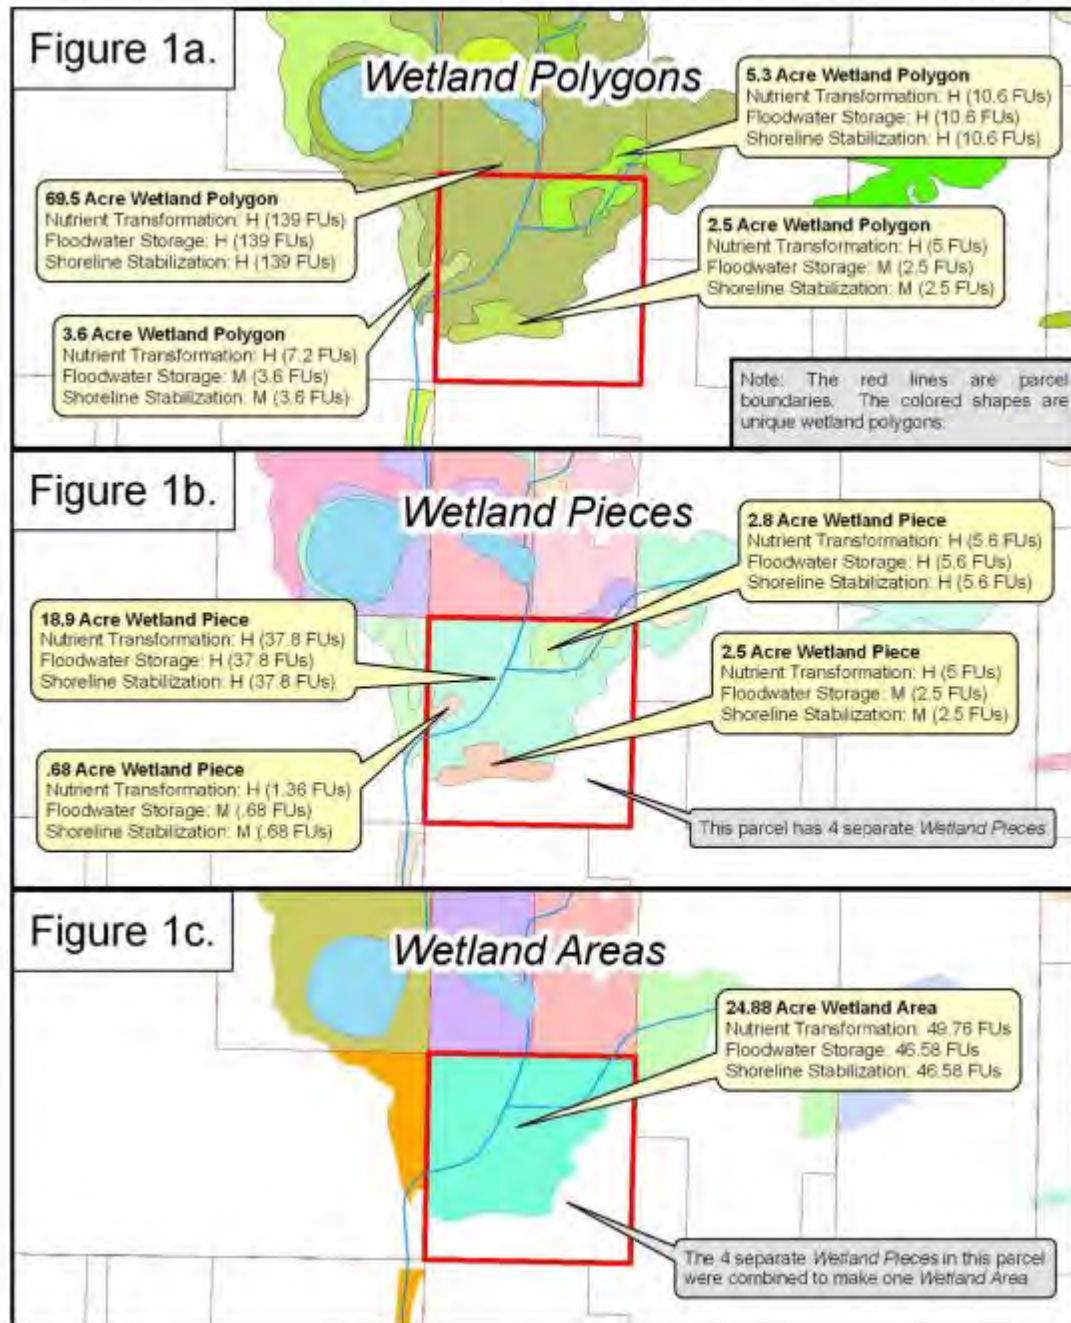

*A Tool to
Protect & Improve
Your Watershed*

Michigan WFA

- Wetland functional assessment – current and historic wetlands
- Parcel and ownership information
- Calculate wetland functional units (acres * functional rank)
- Target restoration and preservation by ownership

Figure 1. Calculating Functional Units (FUs) - Parcel Example

Michigan WFA

Map Presentation Tools

Data Driven Pages

- ArcGIS tool for generating a series of output pages from one layout and a set of map extents
- Extents are define by areas of interest
- Results presented and distributed in PDF format
- Use PDF functions to zoom pan and query

LSB Example

Douglas County Wisconsin

Lake Superior Watershed Maps

2009 Land Cover Analysis

This data was created for Douglas County by the Cooperative Institute for Coastal and Estuarine Environmental Technology (CICEET) program, now the Science Collaborative, which develops, applies, and use the tools to detect, prevent, and reverse the impacts of coastal pollution and habitat degradation on coastal ecosystems and communities.

The purpose of this data set was to measure the percentage of open land, harvested land, and impervious surface within a defined subwatershed system throughout the Douglas County Lake Superior watershed.

ESRI Story Maps

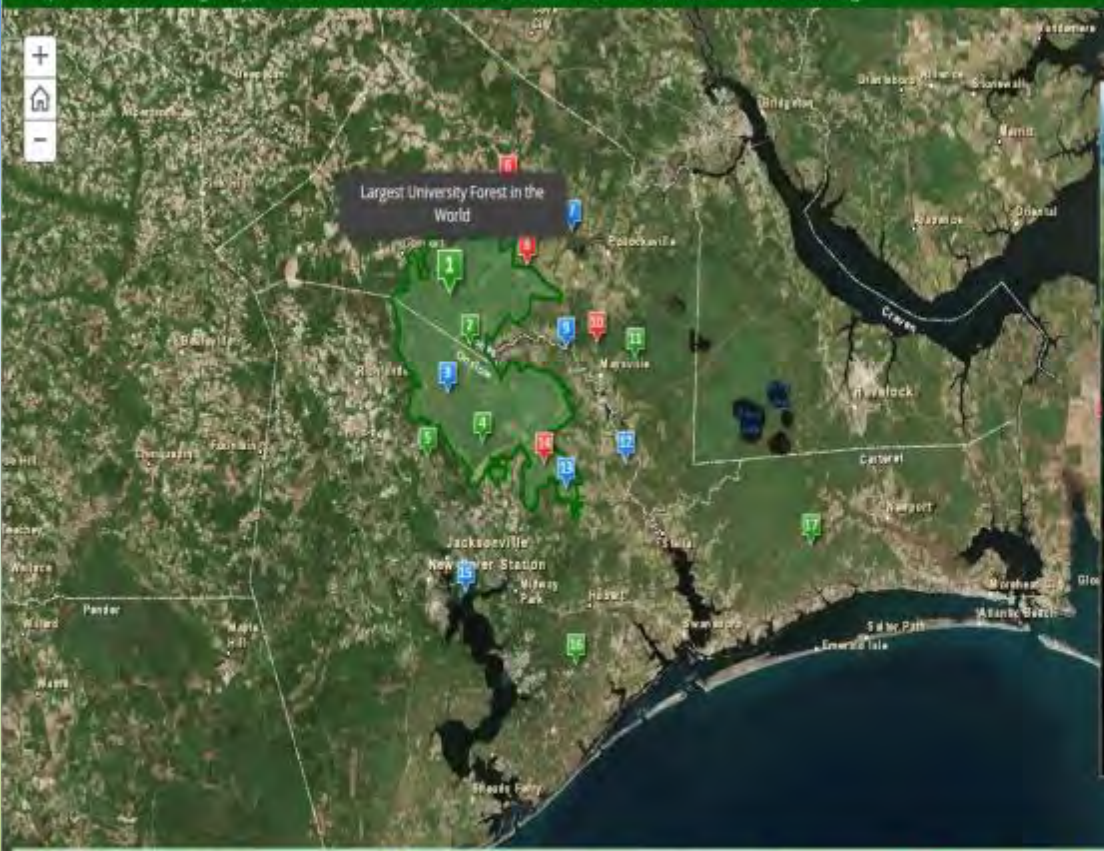

- ArcGIS tool for generating map books for non-technical audiences
- Published over the internet through ArcGIS Online
- Method of summarizing issues for managers and decisions makers
- Assist with collaboration and communication
- Does not require any specialized GIS knowledge or skill.

The Importance of Hofmann Forest - Interactive Map

Hofmann Forest is a 79,000 acre tract of pine forests and wetlands, owned by the Endowment Fund of North Carolina State University. In 2013, NCSU signed an agreement to sell the forest to a private businessman from Illinois (Jerry Walker), but the sale has yet to close. We hope this interactive map will provide citizens with a much better appreciation for why the sale should be stopped and the land should be protected instead. To take action, click the Save Hofmann Forest link to the right.
Map Creators: Alison Montgomery, Ron Sutherland. For more information, contact Ron Sutherland at ron@wildlandsnetwork.org

Pocosin Wetlands

In addition to pine plantations, Hofmann Forest also contains a large block of remnant pocosin wetlands (pocosin means "swamp on a hill", and the forest was once known as White Oak Pocosin). Hofmann Forest is home to a robust population of black bears, and serves as important habitat for bobcats, box turtles, and other wildlife species. The pocosin terrain is difficult to survey, and parts of Hofmann may retain other rare species such as red cockaded woodpeckers, venus fly traps, and eastern diamondback rattlesnakes.

White Oak River Paddling

The beautiful White Oak River is famous for canoeing and fishing. If Hofmann Forest is destroyed, much of the value of this river for recreation may be lost. Photo by Bill Boyarsky.
